Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Digital Enhanced Cordless Telecommunications (DECT).

The present document is based on EN 300 175, parts 1 [1] to 8 [8], EN 300 444 [14] and EN 301 649 [15]. General attachment requirements and speech attachment requirements are based on EN 301 406 [11] (replacing TBR 006 [i.2]) and EN 300 176-2 [10] (previously covered by TBR 010 [i.3]). Further details of the DECT system may be found in TR 101 178 [i.1].

The present document has been developed in accordance to the rules of documenting a profile specification as described in ISO/IEC 9646-6 [12].

The information in the present document is believed to be correct at the time of publication. However, DECT standardization is a rapidly changing area, and it is possible that some of the information contained in the present document may become outdated or incomplete within relatively short time-scales.

The present document is part 4 of a multi-part deliverable covering the New Generation DECT as identified below:

Part 1: "Wideband speech";

Part 2: "Support of transparent IP packet data";

Part 3: "Extended wideband speech services";

Part 4: "Light Data Services; Software Update Over The Air (SUOTA), content downloading and HTTP based applications".

1 Scope

The present document specifies a set of functionalities of the New Generation DECT.

The functionalities defined in this profile are based on DECT base standard, EN 300 175, parts 1 [1] to 8 [8], DECT Generic Access Profile (GAP), EN 300 444 [14], and DECT Packet Radio Service (DPRS), EN 301 649 [15].

The New Generation DECT provides the following basic new functionalities:

- wideband voice service;
- packet-mode data service supporting Internet Protocol with efficient spectrum usage and high data rates.

All DECT devices claiming to be compliant with this Application Profile will offer at least the basic services defined as mandatory. In addition to that, optional features can be implemented to offer additional DECT services.

The aim of the present document is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT data applications, with the features of the present document being a common fall-back option available in all compliant to this profile equipment.

DECT does not standardize Internet Application protocols or other high layer data protocols, which are in the scope of other standardization organizations.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:
  - if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document;
  - for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at http://docbox.etsi.org/Reference.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

2.1 Normative references

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in EN 301 649 [15] and the following apply:

distributed application: application available to the user on a DECT handset, for which part of the code (behaviour) and/or data is located on the handset (local tier) and part of it is located in the network (remote tier), and more specifically on one or more HTTP servers hosted by-or on behalf of-the FP's vendor

downloading server: See Software upgrade downloading server.

Light Data Services (LDS): basic DECT data services with limited data rate and simplified implementation

Management Server (MS): See Software upgrade management server.

software package: set of files sharing the same version identifier, and needed by the PP for installing or upgrading an application or a firmware

NOTE: The software package is often simply referred to as the "software".

software upgrade Downloading Server (DS): site of a PP vendor, or operated on behalf of a PP vendor, from where the software image releases can be downloaded

software upgrade Management Server (MS): site of a PP vendor, or operated on behalf of a PP vendor, where information about new software image releases for handsets, and their locations (on the downloading server) can be found

Software Upgrade Over The Air (SUOTA): capability to upgrade the Software or the Firmware in the PP by means of downloading it from the FP via the DECT air interface

software version identifier: parameter that identifies a software package, including the software package version

NOTE: From PP to FP, this parameter identifies the currently installed software package. From FP to PP it identifies the software package to be installed as a result of the upgrade (and is shared by all the files needed for the upgrade). Details and examples are provided in clause 7.5.5.2.1.

3.2 Symbols

For the purposes of the present document, the symbols given in EN 301 649 [15] and the following apply:

C	For conditional to support (process mandatory)
I	For irrelevant or out-of-scope (provision optional, process optional), not subject for testing
M	For mandatory to support (provision mandatory, process mandatory)
n	Current requested file number (value of the "fileNumber" parameter in the current "Handset Version indication" command).
N/A	For not-applicable (in the given context the specification makes it impossible to use this capability)
N_f	Number of files to be downloaded for a given Software upgrade ($1 \leq N_f \leq 15$).
O	For optional to support (provision optional, process mandatory)
O.x	Option comprising number of items
X	Excluded, not allowed

The symbols defined in this clause are applied for procedures, features, and services in the present document if not explicitly otherwise stated. The interpretation of status columns in all tables is as follows:

- Provision mandatory, process mandatory means that the indicated feature service or procedure shall be implemented as described in the present document, and may be subject to testing.
- Provision optional, process mandatory means that the indicated feature, service or procedure may be implemented, and if implemented, the feature, service or procedure shall be implemented as described in the present document, and may be subject to testing.

NOTE: The used notation is based on the notation proposed in ISO/IEC 9646-7 [13].

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in EN 301 649 [15] and the following apply:

CLIP	Calling Line Identification Presentation
CLSS	ConnectionLess Suplementary Service
D-GMEP	DPRS Generic Media Encapsulation Protocol
DPRS	DECT Packet Radio Service
DS	Download(ing) Server
GAP	Generic Access Profile
GMCI	Generic Media Context Identifier
HTML	HyperText Markup Language
HTTP	HyperText Transfer Protocol
LDS	LightData Services
MS	Management Server
SSL	Secure Sockets Layer
SUOTA	Software Upgrade Over The Air
TLS	Transport Layer Security
URI	Uniform Resource Identifier
URL	Uniform Resource Locator
XHTML	eXtensible HyperText Markup Language
XML	eXtensible Markup Language

4 Description of services

4.1 Services covered by the present document

4.1.1 Introduction

The present document defines a set of what has been named "Light Data Services". Light Data Services are packet mode data services for specific applications, based on DPRS [15], and designed to be implementable using simplified operation modes.

The following Light Data Services are defined by the present document:

- Software Upgrade Over The Air (SUOTA); SUOTA may be automatic, user initiated, or possibly pushed from the management server.
- Binary content download; this is used in SUOTA for the actual software download, and can also be used to define proprietary distributed applications to be used on handsets.
- HTTP based applications; this is intended to allow the design of DECT specific applications based on a limited browsing functionality.

Further Light Data Services may be created by further releases of the present document, or by other DECT specifications.

4.1.2 Application scenario

The Light Data Services defined by the present document have been designed as a complement to voice service terminals. Therefore, the expected scenario is that PPs and FPs implementing the present specification, are also implementing one of the DECT voice services. The services defined by the present document have been optimized to be a natural complement of New Generation DECT; part 1: wideband speech [16], and New Generation DECT: part 3: extended wideband speech services [17]. However, it is also possible the use the Light Data Services in combination with plain GAP [14] terminals.

The application scenario assumes that there is a data connection at the DECT FP that allows the connectivity to external application servers that participate in the service from application point of view. Such data connectivity is typically via the Internet. However, other scenarios of connectivity may exist, including the case when the FP incorporates locally the network side application server. The network side implementation of the scenario is out of the scope of DECT standardization. However, the descriptions given in the present document will assume the most expected case of data connectivity via the Internet, and remote application servers located at any internet location. Other cases, as exotic connectivity or local implementation of the network side server are adaptation of the general scenario, without impact on the DECT air interface protocols.

4.2 Light Data Services Protocol architecture

The common characteristic of all Light Data Services defined by the present document is the use of the DPRS [15], generic media encapsulation interworking mode (DPRS [15], clause B.8). The generic media encapsulation is a DPRS facility that allows the direct transportation of multiple application protocols. In the case of the Light Data Services defined in the present document, the application protocol is HTTP (as defined by RFC 2616 [22]) supporting only the modes defined by DPRS [15], clause B.8.

Another characteristic of the protocol architecture defined in the present document is that the application protocol is transported without the use of any transport layer protocol (TCP [21] or UDP [20]). This approach, that has been chosen in order to simplify implementations, relies on the request/response nature of the application protocol and requires some collaboration from it in order to perform the tasks normally done by the transport layer (TCP).

The result of the approach is that PPs do not need to implement the TCP protocol.

4.2.1 Data protocol reference configuration

Figures 1 and 2 define the U-plane and C-plane protocol stacks used in the Light Data Services defined by the present document.

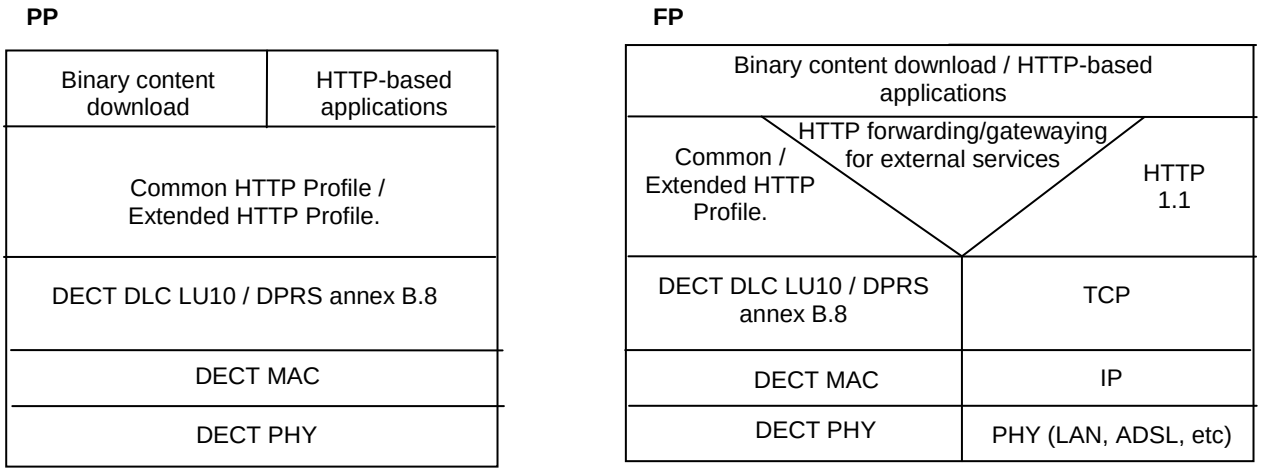

Figure 1: Reference model of the U-plane protocol stack

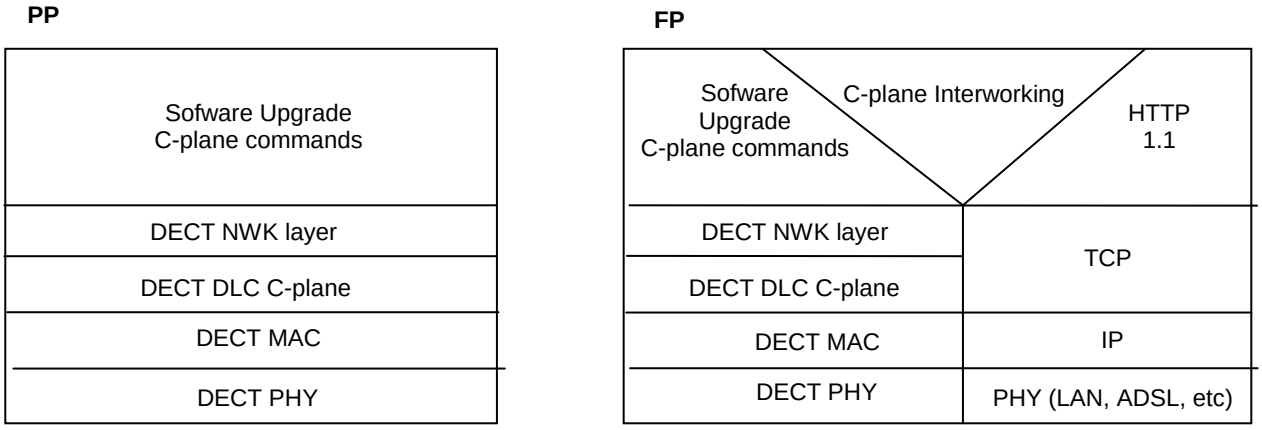

Figure 2: Reference model of the C-plane protocol stack

4.3 Description of functionality and functional split between PT and FT

The top level service provided to the Portable Part implementing the present document is a layer 7 application based on the ietf protocol HTTP [22]. Assuming the most usual scenario, as described in clause 4.1.5, the application level interaction happens between the DECT PP-that is therefore the end-point of the application protocol-and any host located at any Internet location, with TCP/IP connectivity towards the DECT system.

The server located on the Internet-also called the network side server-is a regular "host" from Internet point of view, i.e. it is a host for IP [19], TCP [21] and the application layer. However, in the DECT system, the IP and TCP layers are terminated at the FP, while only the application layer travels to the PP. Therefore the DECT FP is the end-point for IP and TCP connections.

4.3.1 Functionality of the DECT FP

In addition to being the end-point of IP [19] and TCP [21] layers, the FP may be involved in a PP data session in different ways:

- Simple forwarding of PP requests to the WAN (to DECT specific service), with possible adjustment of requests (Range header).
- Forwarding of PP requests to the WAN (to a non DECT specific service), with adjustment of responses to the limited profiles used by the PP ("HTTP Common profile", "HTTP Browsing profile", "Light Browsing profile").
- Addition of a security service: creation of an SSL/TLS tunnel from FP to HTTP server. Refer to [24] for details.
- Hosting of an HTTP server for local services.

4.3.2 Functionality of the DECT PP

The DECT PP acts as the end-point for the application protocol (HTTP). The PP is usually the "client" in a client/server relationship with the network host that is usually the "server". However this asymmetric relation is irrelevant from the DECT point of view, that would as well support the opposite client/server relationship if required.

4.3.3 U-plane interworking and protocol architecture

The U-plane protocol architecture (see figure 1) reflects the principle of TCP and IP termination at FP side. The application protocol (HTTP in all cases covered by the present document) is transported over DPRS LU10 service using the generic encapsulation described in clause B.8 of EN 301 649 [15].

The fact that the air interface transport is done without a transport layer, requires some cooperation from the application layer. In the case of HTTP, the message oriented structure of the protocol with a request/response operation mode in near all cases, makes this direct operation possible. The design of the application at both places should, however, take into account that it will be transported without a transport layer (TCP) over part of the data path.

The DPRS U-plane transport (LU10) is able to deliver the application packets in a reliable way and is able to carry information about the position of the application packet boundaries. In the event of impossibility of reliable transmission (for instance due to successive radio errors), the DPRS U-plane transport is able to indicate to application layer that the received application packet is not complete.

4.3.4 Dynamic considerations on U-plane

Due to the operation without transport layer, one of the factors that must be considered by the HTTP application design at both sides is using a correct value for the maximum size of the HTTP packets (messages). While the operation with TCP allows the transportation of variable size and virtually very large application packets, in the scenario covered by the present document, it is convenient to restrict the size of the packets to proper values, that makes the ratio "size of the application packet/size of the DECT DLC segment" not too large. The DECT DLC segment is the PDU of the LU10, with a size of 64 bytes for 2-level modulation and long slot.

For optimal operation, the value of this ratio should be dynamically adjusted depending on the radio conditions: for optimal radio link quality the size of application packets (and the ratio) may be increased. If the radio link quality decreases, and there are transmission errors and DLC retransmissions, the ratio should be reduced, by reducing the maximum size of the application packets.

NOTE 1: However, this capability of dynamically adjusting the application packet depending on radio conditions requires communication between the DECT Management Entity and the application layer, and is seen as an option for advanced implementations.

A value of 12 kbytes (equivalent to 200 times the DECT PDU size) is considered a convenient value for the maximum application packet size in FT => PT direction, and this is the mandatory figure to be supported by all devices implementing the present document. For the PT => FT direction, the mandatory value to be supported by all implementations is 1,5 kbytes.

The implementations may optionally support the use of larger application packet sizes. The supported maximum size at both sides (when different of the default values) shall be announced by means of the <<Setup Capability>> IE (see clause 12.22 of EN 301 649 [15]). Application packet sizes larger than the default values may only be used when supported by both peers.

The "Range" header of HTTP/1.1 should be used for controlling the application packet size at application level. The value set in the Range header should be consistent with the values announced in <<Setup capabilities>> IE.

When application packet sizes larger than the default values are supported, it is assumed that the implementation has the capability to adjust the real size of the packets according to radio conditions.

NOTE 2: It means that the applications should not use always, by default, the maximum supported size.

PPs should control the size of the own sent application packets, and also the requested value for downlink packets by means of the "Range" header in HTTP/1.1 requests.

The exact value of the application packet size, and how it is related to the radio conditions is up to the implementer.

NOTE 3: A value of 32 000 bytes is equivalent to approximately 5 seconds of transmission over a single bearer, long slot channel and optimal radio conditions.

NOTE 4: The Maximum allowed value of the SDU size defined in IWU-Attributes (see EN 301 649 [15], clause B.2.1) should also be taken into account. The use of application packet sizes larger than the SDU size requires the use of the optional chopping facility (see EN 301 649 [15], clauses B.8.2 and 12.22 for indicator in IE <Setup Capability>). The maximum value in SDU size indicators (EN 301 649 [15], clause B.2.1) is 131 064 bytes.

4.3.5 C-plane interworking

The DECT C-plane is used for different functions in the Light Data Services architecture. One of the most obvious is the DPRS virtual call setup and release. In most application cases, this is usually done by the PP side after request of the data application (see for instance the figure 3). On the FP side, the sending of HTTP requests through the set-up virtual call triggers the opening of one or several TCP connections with the distant Internet host, or hosts (since in some scenarios several hosts participate in the service). In some cases, the DECT C-plane is used to transport the routing information (URL) of this network side server (see clause 7.5.5.2.1).

It is also possible to use the opposite scenario, where the DECT FP receives a TCP connection from a distant host, and this action triggers a FP initiated virtual call setup towards the PP. This scenario is, however, less usual and, because of it, the FP initiated virtual call is optional.

4.4 Service and Performance Objectives

In order to allow wide use of the present specification, and taking into account that in most cases it will be a complement of DECT voice services, only single bearer operation over long slot and DPRS Class 4 are defined as mandatory. There is however the option of introducing DPRS Class 3 or Class 2 operation, and, when combined with Class 2, multibearer and asymmetric bearers support.

The service and performance objectives are shown in tables 1 and 2.

Table 1: Summary of service capabilities

Service	DPRS Class mode		
	Class 4	Class 3	Class 2
Point-to-point protected data transfer PP-FP with ARQ	YES	YES	YES
Point-to-point protected data transfer FP-PP with ARQ	YES	YES	YES
Point-to-multi-point data transfer FP-PP	-	-	-
Point-to-point data transfer PP-PP (distributed communication)	-	-	-
Authentication	YES	YES	YES
Encryption	YES	YES	YES
Connection oriented operation	YES	YES	YES
Virtual Call (VC) operation	YES	YES	YES
Intra-cell bearer handover	YES	YES	YES
Inter-cell bearer handover	YES	YES	YES
Inter-cell connection handover (for multicell systems)	OPTIONAL	OPTIONAL	OPTIONAL
Inter-cell external handover	OPTIONAL	OPTIONAL	OPTIONAL
Suspend /resume	-	OPTIONAL	YES
Multibearer connections			YES
Asymmetric connections			YES
Fast setup			OPTIONAL

Table 2: Summary of Performance objectives

Performance	DPRS Class	
	Class 3 or 4	**Class 2**
Maximum supported SDU size (FT = > PT)	≥ 12 224 octets	≥ 12 224 octets
Maximum supported SDU size (PT = > FT)	≥ 1 528 octets	≥ 1 528 octets
Mandatory sustainable unidirectional or bidirectional throughput.	64 kbit/s	64 kbit/s
Optional maximum sustainable unidirectional throughput (Class 2 system), GFSK 2-level modulation.	-	844,8 kbit/s net
Optional sustainable full bi-directional throughput (DPRS Class 2 system), GFSK 2-level modulation	-	460,8 kbit/s net
Maximum one-way delay	Down to 50 ms configurable	Down to 50 ms configurable
Establishment of PT to FT physical connection (average)	< 50 ms	< 50 ms
Establishment of FT to PT physical connection (average)	< 50 ms	< 50 ms
Undetected bit error ratio	$< 10^{-10}$	$< 10^{-10}$
Uncorrected bit error ratio (for air interface BER 10^{-3} and delay = 100 ms)	$< 10^{-7}$	$< 10^{-7}$

4.5 General application environments

Figures 3 and 4 describe the general application scenario of the Light Data Services described in the present document.

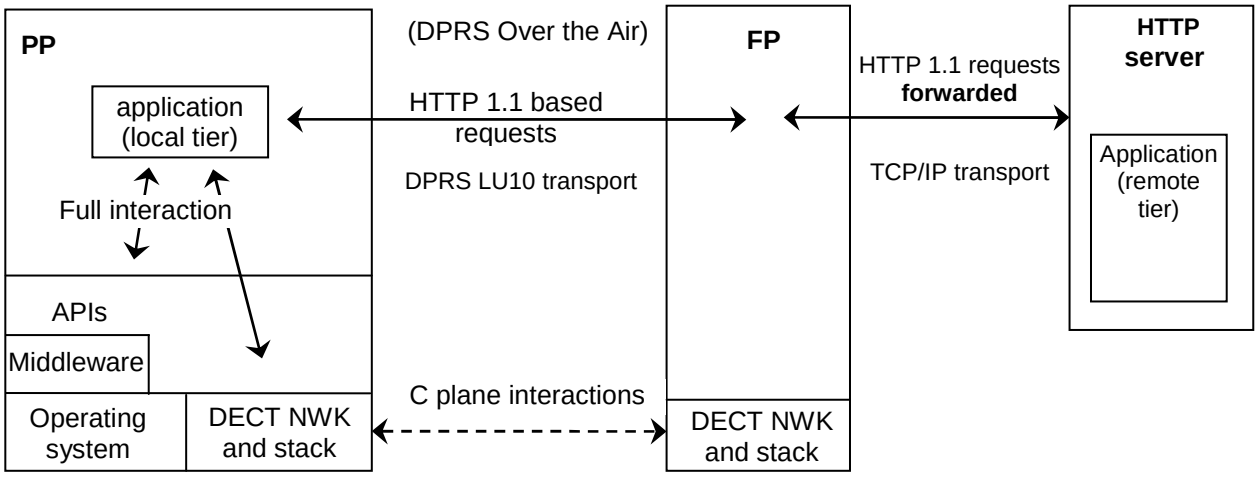

Figure 3: General application scenario (applicable to all services)

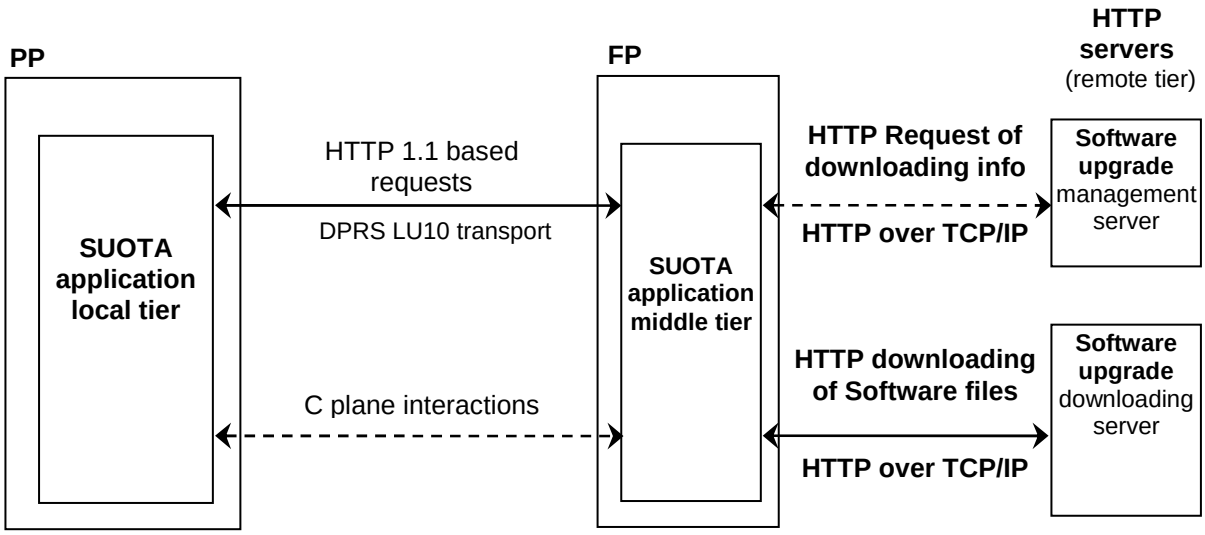

Figure 4: Application scenario for Software upgrade over the air (SUOTA)

5 Relevant requirements

The requirements of EN 301 649 [15] relevant for Class 2, Class 3 or Class 4 equipment shall apply with the modifications stated in clauses 5 and 6 of the present document.

The encapsulation of external data protocol shall be done as stated in EN 301 649 [15], clause B.8.

In any case, the requirements of EN 300 176-1 [9] and any of the harmonized standard EN 301 406 [11] shall apply as well.

5.1 Service and feature definitions

5.1.1 PHL service definitions

For the purpose of the present document, the definitions of EN 301 649 [15], clause 4.3.1 shall apply.

5.1.2 MAC service definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.2 shall apply.

5.1.3 DLC service definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.3 shall apply.

5.1.4 NWK feature definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.4 plus the following shall apply:

General Light Data Service Procedures [NGLDS-N.1]: NWK layer procedures needed for the operation of this profile.

Software upgrade over the air, C-plane [NGLDS-N.2]: NWK layer procedures needed for upgrading the software of the PP.

5.1.5 Application service definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.5 plus the following shall apply:

Binary content download [NGLDS-A.1]: Ability to download binary files (or other) from a content server using HTTP protocol.

Software upgrade over the air [NGLDS-A.2]: Ability to upgrade the software of the PP.

HTTP-based applications [NGLDS-A.3]: Ability to browse HTML pages from the PP.

5.1.6 Management Entity (ME) definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.7 shall apply.

5.1.7 Call Control (CC) and mobility management service definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.8 shall apply.

5.1.8 U-plane service and interworking definitions

For the purposes of the present document, the definitions of EN 301 649 [15], clause 4.3.9 shall apply.

6 Profile specific requirements

6.1 General

The tables listed in this clause define the status of all protocol elements (i.e. features, services, and procedures), which can be: mandatory, optional, conditional under the provision of another protocol element, outside the scope of the present document, or not applicable. The status is identified by the status column designations defined in clause 3.2, and is described separately for FT and PT.

All optional elements shall be process mandatory according to the procedures described in the present document.

Protocol elements defined as mandatory, optional or conditional in this clause are further defined in the referenced DECT specification, or, if needed, in clause 7 of the present document.

New Generation DECT; part 4 is defined as an application specific access profile of DPRS [15]. All procedures not specific to the New Generation DECT, part 4, are referenced to their original description in EN 301 649 (DPRS) [15].

The requirements of EN 301 649 [15] relevant for Class 2, Class 3 or Class 4 (depending on the supported Class(es)) equipment shall apply with the modifications stated, if needed, in clause 7 of the present document.

The encapsulation of external data protocol shall be done as stated in EN 301 649 [15], clause B.8 (Generic media encapsulation) and clause B.8.3.4 (HTTP limited set nr. 2).

NOTE: The HTTP limited set nr. 2 (EN 301 649 [15], clause B.8.3.4) implements the mandatory requirements of the present document (see clauses 7.6, A.1 and A.2). The HTTP limited set nr. 2, contrarily to the HTTP limited set nr. 1 (EN 301 649 [15], clause B.8.3.3), does not require that all FP implementations include a full HTTP implementation. Some FPs could even be designed to be as transparent as possible from the application-layer point of view (i.e. HTTP), relying on the HTTP subset implemented by the PP to ensure the dialog with the server. One of the reasons for this is that full-featured browsing is not among the first targeted applications of the present document (although some PP implementations could be rich enough to allow it). Also, some of the targeted applications could rely on a NG-DECT part 4 specific server (a server implementing the requirements of the present document), thus purposely restricting the set of HTTP features used on server side.

In any case, the requirements of EN 300 176-1 [9], EN 300 176-2 [10] and any of the harmonized standard EN 301 406 [11] shall be met by all equipment conforming to the present document.

The requirements tables in the following clauses are derived from the EN 301 649 [15]. In the service to procedure and feature to procedure mapping tables, the status of each particular item is explicitly stated only when it constitutes a change to the status indicated in EN 301 649 [15].

6.2 General class/service/interworking support

6.2.1 Class/service support

The following service classes and end-user services shall be supported by New Generation DECT, part 4 equipment.

Table 3: General class and service support

Item	Name of service	Reference	Support status	
			PT	FT
DPRS-G.1	DPRS Class 1	4.3.8 [15]	I	I
DPRS-G.2	DPRS Class 2	4.3.8 [15]	O	O
DPRS-G.3	Frame Relay (FREL)	4.3.9 [15] and annex B [15]	M	M
DPRS-G.4	Character stream	4.3.9 [15] and annex C [15]	I	I
DPRS-G.5	DPRS Class 3	4.3.9 [15] and annex C [15]	O	O
DPRS-G.6	DPRS Class 4	4.3.9 [15] and annex C [15]	M	M
NOTE: The reference column refers to the relevant clause in the referenced document.				

6.2.2 Protocol interworking support

The following protocol interworking modes shall be supported by New Generation DECT, part 4 equipment.

Table 4: General service/interworking support

			Status	
Service	Interworking	Reference	PT	FT
DPRS-G.3, Frame Relay (FREL)		4.3.9 [15] and annex B [15]	M	M
	DPRS-I.1, Ethernet	4.3.9 [15] and B.4 [15]	I	I
	DPRS-I.2, Token Ring	4.3.9 [15] and B.5 [15]	I	I
	DPRS-I.3, IP	4.3.9 [15] and B.6 [15]	I	I
	DPRS-I.4, PPP	4.3.9 [15] and B.7 [15]	I	I
	DPRS-I.5, Generic media encapsulation	4.3.9 [15], B.8 [15] and 7.6.1.2 (see note 2)	M	M
DPRS-G.4, Character stream		4.3.9 [15] and annex C [15]	I	I
	DPRS-I.6, V.24	4.3.9 [15] and C.4 [15]	I	I
NOTE 1: The reference column refers to the relevant clause in the present or in the referenced document. NOTE 2: The applicable clauses in 7.6.1.2 according to table 13 shall apply.				

On regard to the Interworking conventions, the specific interworking requirements described in clause 7.7 shall also apply.

6.3 Void

6.4 Physical layer (PHL) requirements

6.4.1 Physical layer (PHL) services

New Generation DECT, part 4 devices shall support the following Physical layer (PHL) services.

Table 5: Physical layer service support

Item	Name of service	Reference	Support status	
			PT	FT
DPRS-P.1	GFSK modulation	4.3.1 [15]	M	M
DPRS-P.2	π/2 DBPSK modulation	4.3.1 [15]	O	O
DPRS-P.3	π/4 QBPSK modulation	4.3.1 [15]	O	O
DPRS-P.4	π/8 D8PSK modulation	4.3.1 [15]	O	O
DPRS-P.5	16 QAM modulation	4.3.1 [15]	O	O
DPRS-P.6	64 QAM modulation	4.3.1 [15]	O	O
DPRS-P.7	Physical Packet P32	4.3.1 [15]	O	O
DPRS-P.8	Physical Packet P64	4.3.1 [15]	M	M
DPRS-P.9	Physical Packet P67	4.3.1 [15]	O	O
DPRS-P.10	Physical Packet P80	4.3.1 [15]	O	O
DPRS-P.11	General PHL	4.3.1 [15]	M	M
DPRS-P.12	Fast hopping radio	4.3.1 [15]	O	O
NOTE: The reference column refers to the relevant clause in the referenced document.				

6.4.2 Modulation schemes

The following modulation schemes defined by EN 300 175-2 [2], annex D shall be supported.

Table 6: Allowed combinations of modulation schemes

Modulation scheme	S-field	A-field	B + Z-field	Support status
1a	GFSK	GFSK	GFSK	M
1b	π/2-DBPSK	π/2-DBPSK	π/2-DBPSK	O
2	π/2-DBPSK	π/2-DBPSK	π/4-DQPSK	O
3	π/2-DBPSK	π/2-DBPSK	π/8-D8PSK	O
5	π/2-DBPSK	π/2-DBPSK	16 QAM	O
6	π/2-DBPSK	π/2-DBPSK	64 QAM	O

6.4.3 PHL service to procedure mapping

The PHL service to procedure mapping of EN 301 649 [15], clause 5.3 shall apply.

6.5 MAC layer requirements

6.5.1 MAC layer services

New Generation DECT data devices shall support the following MAC layer services.

Table 7: MAC service support

Item	Name of service	Reference	Support status	
			PT	FT
DPRS-M.1	General	4.3.2 [15]	M	M
DPRS-M.2	Non continuous broadcast	4.3.2 [15]	O	O
DPRS-M.3	Continuous broadcast	4.3.2 [15]	M	M
DPRS-M.4	Paging broadcast	4.3.2 [15]	M	M
DPRS-M.5	B-field advanced connection control	4.3.2 [15]	O	O
DPRS-M.6	I_{PM}_error_detection	4.3.2 [15]	M	M
DPRS-M.7	I_{PM}_error_correction	4.3.2 [15]	O	O
DPRS-M.8	U-plane point-to-multipoint service	4.3.2 [15]	I	I
DPRS-M.9	C_S higher layer signalling	4.3.2 [15]	M	M
DPRS-M.10	C_F higher layer signalling	4.3.2 [15]	O	O
DPRS-M.11	Encryption activation	4.3.2 [15]	M	M
DPRS-M.12	Encryption deactivation	4.3.2 [15]	C73	C73
DPRS-M.13	Quality control	4.3.2 [15]	M	M
DPRS-M.14	Physical channel selection	4.3.2 [15]	M	M
DPRS-M.15	SARI support	4.3.2 [15]	M	O
DPRS-M.16	DPRS Bearer handover	4.3.2 [15]	M	M
DPRS-M.17	Fast setup	4.3.2 [15]	C74	C74
DPRS-M.18	Connection handover	4.3.2 [15]	O	O
DPRS-M.19	G_F channel	4.3.2 [15]	C76	C76
DPRS-M.20	I_{PQ}_error_detection	4.3.2 [15]	O	O
DPRS-M.21	I_{PQ}_error_correction	4.3.2 [15]	O	O
DPRS-M.22	I_{Px}_encoded protected	4.3.2 [15]	C75	C75
DPRS-M.23	I_{PF} channel	4.3.2 [15]	C76	C76
DPRS-M.24	Full slot	4.3.2 [15]	O	O
DPRS-M.25	Long slot 640	4.3.2 [15]	M	M
DPRS-M.26	Long slot 672	4.3.2 [15]	O	O
DPRS-M.27	Double slot	4.3.2 [15]	O	O
DPRS-M.28	Multibearer connections	4.3.2 [15]	C74	C74
DPRS-M.29	Asymmetric connections	4.3.2 [15]	C74	C74
DPRS-M.30	Simplified A-field advanced connection control	4.3.2 [15]	M	M
C73: IF DPRS-N.28 or DPRS-N.29 then M else I.				
C74: IF DPRS-M.5 THEN O ELSE I.				
C75: IF DPRS-P.5 (16 QAM) OR DPRS-P.6 (64 QAM) THEN M ELSE O.				
C76: IF DPRS-M.29 THEN M ELSE O.				
NOTE: The reference column refers to the relevant clause in the referenced document.				

6.5.2 MAC service to procedure mapping

The MAC layer service to procedure mapping specified in EN 301 649 [15], clause 6.2, with the following changes and additional features shall apply.

Table 8: MAC service to procedure mapping

			Status	
Service	**Procedure**	**Reference (clause)**	**PT**	**FT**
DPRS-M.1 General		4.3.2 [15]	M	M
	Frame and Multiframe structure	10.1.1 [15]	M	M
	Bit mappings	10.1.2 [15]	M	M
	Scrambling	10.1.4 [15]	M	M
	Error control	10.1.5 [15]	M	M
	RFP idle receiver scan sequence	10.1.8 [15]	M	M
	PT states and state transitions for PTs not supporting fast setup	10.1.10.1 [15]	C802	C802
	Identities	10.1.11 [15]	M	M
	A-field Multiplexer (T-MUX)	10.21.1 [15]	M	M
	B-field control Multiplexer (E/U-MUX), basic modes	10.21.2.1 [15]	C804	C804
DPRS-M.2 Non continuous broadcast		4.3.2 [15]	O	O
	Request for specific Q channel information	10.2.1 [15]	O	O
	Request for a new dummy	10.2.2 [15]	O	O
DPRS-M.3 Continuous broadcast		4.3.2 [15]	M	M
	Downlink broadcast	10.3 [15]	M	M
DPRS-M.4 Paging broadcast		4.3.2 [15]	M	M

NOTE: The reference column refers to the relevant clause in EN 301 649 [15] or in the referenced document.				

6.6 DLC layer

6.6.1 DLC layer services

New Generation DECT, part 4 devices shall support the following DLC layer services.

Table 9: DLC service status

Item no.	Name of service	Reference	Status PT	Status FT
DPRS-D.1	LU10 Enhanced Frame RELay service (EFREL)	4.3.3 [15]	M	M
DPRS-D.2	FU10a	4.3.3 [15]	M	M
DPRS-D.3	FU10b	4.3.3 [15]	I	I
DPRS-D.4	FU10c	4.3.3 [15]	M	M
DPRS-D.5	Data Link Service (LAPC + Lc) class A service	4.3.3 [15]	M	M
DPRS-D.6	Data Link Service (LAPC + Lc) class U service	4.3.3 [15]	O	O
DPRS-D.7	Lc Frame delimiting and sequencing service	4.3.3 [15]	M	M
DPRS-D.8	Broadcast Lb service	4.3.3 [15]	M	M
DPRS-D.9	Inter-cell voluntary connection handover	4.3.3 [15]	O	O
DPRS-D.10	Connection modification	4.3.3 [15]	C92	C92
DPRS-D.11	Encryption activation	4.3.3 [15]	M	M
DPRS-D.12	Encryption deactivation	4.3.3 [15]	C91	C91
DPRS-D.13	Connectionless U-plane	4.3.3 [15]	I	I
C91: If DPRS-N.28 or DPRS-N.29 then M else I. C92: (If DPRS-M.5 THEN M ELSE O).				
NOTE: The reference column refers to the relevant clause in the referenced document.				

6.6.2 DLC service to procedure mapping

The DLC layer service to procedure mapping specified in EN 301 649 [15], clause 7.2 shall apply.

6.7 NWK layer

6.7.1 General

The NWK layer provisions shall include the following entities:

- Call Control (CC).
- Mobility Management (MM).
- Link Control Entity (LCE).
- ConnectionLess Message Service (CLMS).

New Generation DECT data equipment is based on DPRS Class 2 (see clause 4.3.8 [15]), and therefore requires a NWK layer.

6.7.2 NWK features

New Generation DECT data devices shall support the following NWK layer features.

Table 10: NWK features status

Feature supported				
Features			Status	
Item no.	Name of feature	Reference	PT	FT
DPRS-N.1	PT initiated virtual call	4.3.4 [15]	M	M
DPRS-N.2	Off hook	4.3.4 [15]	M	M
DPRS-N.3	On hook (full release)	4.3.4 [15]	M	M
DPRS-N.4	Dialled digits (basic)	4.3.4 [15]	O	O
DPRS-N.5	Register recall	4.3.4 [15]	O	O
DPRS-N.6	Go to DTMF signalling (defined tone length)	4.3.4 [15]	O	O
DPRS-N.7	Pause (dialling pause)	4.3.4 [15]	O	O
DPRS-N.8	FT initiated virtual call	4.3.4 [15]	O	O

	Support of additional HTTP header fields	7.6.3.2	M	M
	Support of additional media-types	7.6.3.3	M	M
	Support of character encodings	7.6.3.4	M	M
	Simple XHTML profile	7.6.3.5	M	M
	Baseline XHTML profile	7.6.3.6	O	M
	Extended HTTP profile	A.2	C1301	M
C1301: IF Baseline XHTML profile supported THEN M ELSE O.				
NOTE: The reference column refers to the relevant clause in the present document.				

6.9 Distributed communications

The distributed communication mode (PP-PP communication) is not part of the present document.

Table 14: Distributed communication requirements

Feature supported			Status		
Feature	**Name of feature**	**Ref.**	**PT**	**FT**	HyP
DPRS-DC.1	Distributed Communication	4.3.6 [15]	I	I	I
NOTE: The reference column refers to the relevant clause in the referenced document.					

6.10 Management Entity (ME)

6.10.1 Management Entity (ME) operation modes

In regard to the New Generation DECT, part 4equipment, the following ME operation modes from EN 301 649 [15], clause 9.1 shall apply.

Table 15: Management Entity Requirements

Feature supported			Status	
Feature	**Name of feature**	**Ref.**	**PT**	**FT**
DPRS-ME.1	Class 1 management	4.3.7 [15]	I	I
DPRS-ME.2	Class 2 management	4.3.7 [15]	O	O
DPRS-ME.3	Class 3 management	4.3.7 [15]	O	O
DPRS-ME.4	Class 4 management	4.3.7 [15]	M	M
NOTE: The reference column refers to the relevant clause in the referenced document.				

6.10.2 Management Entity (ME) mode to procedures mapping

In regard to the New Generation DECT, part 4 equipment, the operation mode to procedure mapping specified in EN 301 649 [15], clause 9.1.2 shall apply.

7 Profile specific procedures description

7.1 General

This clause identifies differences and additions to the feature/service/procedure definitions and descriptions as specified in EN 301 649 [15], DPRS.

7.2 Management Entity (ME) procedures

No differences/additions - the procedures as specified in EN 301 649 [15], clauses 9 and A.1 shall apply.

7.3 MAC layer procedures

No differences/additions - the procedures as specified in EN 301 649 [15], clause 10 shall apply.

7.4 DLC layer procedures

No differences/additions - the procedures as specified in EN 301 649 [15], clause 11 shall apply.

7.5 NWK layer procedures

The procedures as specified in EN 301 649 [15], clause 12 shall apply with the modifications and additional procedures listed in the present clause.

7.5.1 PT initiated virtual call request (outgoing call)

The following text together with the associated clauses defines the mandatory requirements with regard to the present document:

The procedure shall be performed as defined in EN 300 444 [14], clause 8.12 with the following specific provisions:

The information elements supported by the CC-SETUP message depends on the support of feature DPRS-N.34 (Service negotiation):

If feature DPRS-N.34 is not supported, then:

- the Information element <<Basic Service>> shall be transmitted;
- the field <basic service> in the IE <<Basic service>> shall be set to one of the following basic services defined in EN 300 175-5 [5]:
  - basic service = Light data service with ME Class 4 (code= '1001'B);
  - basic service = Light data service with ME Class 3 (code= '1010'B);
- the Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> shall not be transmitted;
- the virtual call can only be setup with initial parameters as defined by the basic service.

If feature DPRS-N.34 is supported, then all information elements described in the procedures associate to this feature may be used. In this case the IE <<Basic Service (basic service = other) may be used. The IE <<Basic Service (basic service = light data service with ME Class 4 or light data service with ME Class 3)>> may also be used defining a default setting for all parameters not transmitted in the IEs.

NOTE 1: Any parameter transmitted in any of the IEs supersedes the default setting done by the "Basic service".

In any case (DPRS-N.34 supported or not), the parameters of the call may be changed after setup using the feature DPRS-N.35, if supported.

NOTE 2: If neither feature DPRS-N.34 nor DPRS-N.35 are supported, then only calls with parameter setting equal to the basic service may be set up.

Table 16: Values used within the {CC-SETUP} message

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<< Basic service >>			
	< Basic service >	'1001'B	Light data service default setup attributes with ME Class 4 (see note 2)
	< Basic service >	'1010'B	Light data service default setup attributes with ME Class 3 (see note 2)
	< Basic service >	'1111'B	Other
NOTE 1: For the additional information elements needed to identify the required service/parameters see DPRS-N.34 Service Negotiation feature. NOTE 2: Default light data service setup attributes are described in clause A.2 of DPRS (EN 301 649 [15]).			

7.5.2 FT initiated virtual call request (incoming call)

The following text together with the associated clauses defines the mandatory requirements with regard to the present document.

The procedure shall be performed as defined in EN 300 444 [14], clause 8.12 with the following specific provisions.

The information elements supported by the CC-SETUP message depends on the support of feature DPRS-N.34 (Service negotiation).

If feature DPRS-N.34 is not supported, then:

- The Information element <<Basic Service>> shall be transmitted;
- The field <basic service> in the IE <<Basic service>> shall be set to one of the following basic services defined in EN 300 175-5 [5]:
  - Basic service = Light data service with ME Class 4 (code= '1001'B);
  - Basic service = Light data service with ME Class 3 (code= '1010'B);
- The Information elements << IWU ATTRIBUTES >>, << CALL ATTRIBUTES >>, << CONNECTION ATTRIBUTES >>, << TRANSIT DELAY >> and << WINDOW SIZE >> shall not be transmitted;
- The virtual call can only be setup with initial parameters as defined by the basic service.

If feature DPRS-N.34 is supported, then all information elements described in the procedures associated to this feature may be used. In this case the IE <<Basic Service (basic service = other) may be used. The IE <<Basic Service (basic service = light data service with ME Class 4 or light data service with ME Class 3)>> may also be used defining a default setting for all parameters not transmitted in the IEs.

NOTE 1: Any parameter transmitted in any of the IEs supersedes the default setting done by the "Basic service".

In any case (DPRS-N.34 supported or not), the parameters of the call may be changed after setup using the feature DPRS-N.35, if supported.

NOTE 2: If neither feature DPRS-N.34 nor DPRS-N.35 are supported, then only calls with parameter setting equal to the basic service may be set up.

Table 17: Values used within the {CC-SETUP} message

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<< Basic service >>			
	< Basic service >	'1001'B	Light data service default setup attributes with ME Class 4 (see note 2)
	< Basic service >	'1010'B	Light data service default setup attributes with ME Class 3 (see note 2)
	< Basic service >	'1111'B	Other
NOTE 1: For the additional information elements needed to identify the required service/parameters see DPRS-N.34 Service Negotiation feature. NOTE 2: Default light data service setup attributes are described in clause A.2 of DPRS (EN 301 649 [15]).			

7.5.3 Service Negotiation specific rules

The additional Information elements described as part of feature DPRS-N.34 shall be used in calls using Management Class 2 (DPRS-ME.2) and may only be used in Calls using ME.4 (mandatory mode) or ME.3 when both peers have announced (in <<SETUP CAPABILITY>> the support of the procedures "LU10 Interworking conventions and HTTP profile for enhanced binary content download" (see clause 7.6.1.2.2) or "LU10 Interworking conventions and HTTP profile for Generic multiprotocol binary content download" (see clause 7.6.1.2.3). Calls using ME.4 or ME.3 when any of the peers only supports the basic procedure "LU10 Interworking conventions and HTTP profile for simple binary content download" (see clause 7.6.1.2.1) shall be always set up using basic service IE and shall not use the IE part of DPRS-N.34. The parameters of the call may be changed after initial set up using Service Change (DPRS-N.35) if supported.

NOTE 1: If neither feature DPRS-N.35 nor DPRS-N-34 are supported, only calls with parameter setting equal to the basic service may exist.

NOTE 2: The rule is intended for implementations supporting DPRS-N.34 due to the support of DPRS-ME.2, or any of the optional binary content download procedures, when initiating a call with a peer that does not support DPRS-N.34, in order to avoid the rejection of the setup due to the lack of support of DPRS-N.34 by the other side.

7.5.4 General procedures

This clause lists specific general procedures applicable to all services provided by this profile.

7.5.4.1 Service change rejection

Any implementation not supporting the feature DPRS-N.35 (Service change) shall at least be able to reject an incoming {CC-SERVICE-CHANGE} message with a {CC-SERVICE-REJECT}, even if the implementation does not understand completely the message because it does not support the handling of long NWK layer messages (EN 301 649 [15], clause 12.20).

7.5.4.2 Interactions with telephony service

This clause describes the applicable procedure to solve the possible interactions in devices (PP or FP) implementing the present document and also a voice telephony service as described in EN 300 444 (GAP) [14], TS 102 527-1 [16] or TS 102 527-3 [17].

The procedures described in the present clause determine the basic rules for handling the interaction. The following subprocedures are provided and shall be supported by all devices implementing the present document plus any voice telephony service (either EN 300 444 (GAP) [14], TS 102 527-1 [16] or TS 102 527-3 [17]):

- Switching procedure when a light data service call is already established and there is an incoming voice call.
- Using a light data service when a voice call is already established.
- Handling of other interactions.

The procedures for simultaneous handling of light data service and voice calls require further study and will be added in future revisions of the present document.

7.5.4.2.1 Switching procedure when a light data service call is already established and there is an incoming voice call

This clause describes the behaviour of systems which do not support simultaneously data and voice calls but that may however switch from data to voice calls, when an incoming voice call happens during a light data service call. It provides the mechanisms for notification of a possible incoming voice call when a data call is in progress, and for possible switching between the calls.

Setting the "Support of simultaneous DPRS and voice calls " flag in <<SETUP CAPABILITY>>

The PP and FP shall set correctly the << SETUP-CAPABILITY >> IE, bits 4, 5 of octet 4 "Support of simultaneous DPRS and voice calls".

All devices implementing the present document plus any voice telephony service (either GAP (EN 300 444 [14]), TS 102 527-1 [16] or TS 102 527-3 [17]) shall support and at least "Simultaneous DPRS and voice calls not supported, however switching procedure supported".

If PP or FP supports more enhanced behaviours (simultaneous voice and data calls active or not):

- This entity shall align its behaviour to the remote entity capability if it is lower.
- Those more enhanced behaviours are not defined in detail in this version of the current specification.

NOTE 1: The explicit setting of bits 4, 5 of octet 4 in << SETUP-CAPABILITY >> is only needed in devices supporting the feature DPRS-N.33 "Dynamic parameters allocation". For devices that only support the behaviour defined in a basic service, the proper setting of the bits is already included in the basic service definition. See EN 301 649 (DPRS) [15], clause A.2.

Incoming voice call during preliminary exchanges of the SUOTA process

If an incoming internal or external call occurs while the PP has started a SUOTA process:

- either PP and FP are exchanging C-plane <<IWU-WU>> commands;
- or PP is upgrading its memory due to the firmware upgrade.

The FP shall present the incoming voice call as a standard incoming call to the PP. The PP may process or ignore this incoming call.

NOTE 2: Call might not even be presented to the user on PP side. However this should be carefully handled by the PP as this is considered as a temporary interruption of the telephony service for the user.

Incoming voice call while light data service call is already established

This clause describes how to process an incoming internal or external voice call when a data connection is already established. The data call may be related to any of the light data services.

When receiving an incoming internal or external voice call during an ongoing light data service call, the following procedures of TS 102 527-3 [17] shall be used with the modifications stated in the present document:

- "Call waiting indication (external or internal)", see TS 102 527-3 [17], clause 7.4.3.5.2.
- "Call waiting rejection", see TS 102 527-3 [17], clause 7.4.3.5.7.
- "CLIP on call waiting" see TS 102 527-3 [17], clause 7.4.3.5.10.
- "CNIP on call waiting", see TS 102 527-3 [17], clause 7.4.3.5.11.

For the PP involved in the light data service, the FP shall indicate the incoming voice call using the "Call waiting indication (external or internal)" procedure of TS 102 527-3 [17], additionally the FP shall use the "CLIP on call waiting" as well as "CNIP on call waiting" procedures of TS 102 527-3 [17].

When receiving this call waiting indication, the PP shall decide between any of the following options:

- Either continue with the light data service call (and ignore the call waiting).

EXAMPLE: This may be the case when the PP is involved in a critical step of a Software update procedure.

- Or reject the incoming call using the "Call waiting rejection (from PP to FP)" procedure of TS 102 527-3 [17].
- Or switch from the data call to the voice call. For this, the PP shall release it using a {CC-RELEASE} message. The FP shall answer with a {CC-RELEASE-COM} message. If the voice call is still waiting, the FP shall re-present the incoming call by sending a {CC-SETUP} message. See figure 5 below for details of data service to voice call switching procedure.
- The decision taken by the PP shall be based on the type of light data service, the state of the process, its own implementation capabilities, and may involve, or not, interaction with the end-user.

NOTE 3: In the PP is performing a Software Upgrade over the air, the PP is responsible to ensure that the decision taken does not compromise its vital functions.

In the meantime, if the remote party desists from the call, or if another PP accepts the call, the FP shall use the " call release and call release rejection" procedure of TS 102 527-3 [17] to inform the PP that the incoming voice call is no longer relevant (use of call status CS idle). The PP shall, in this case, not continue with the switching procedure. See figure 6 for details.

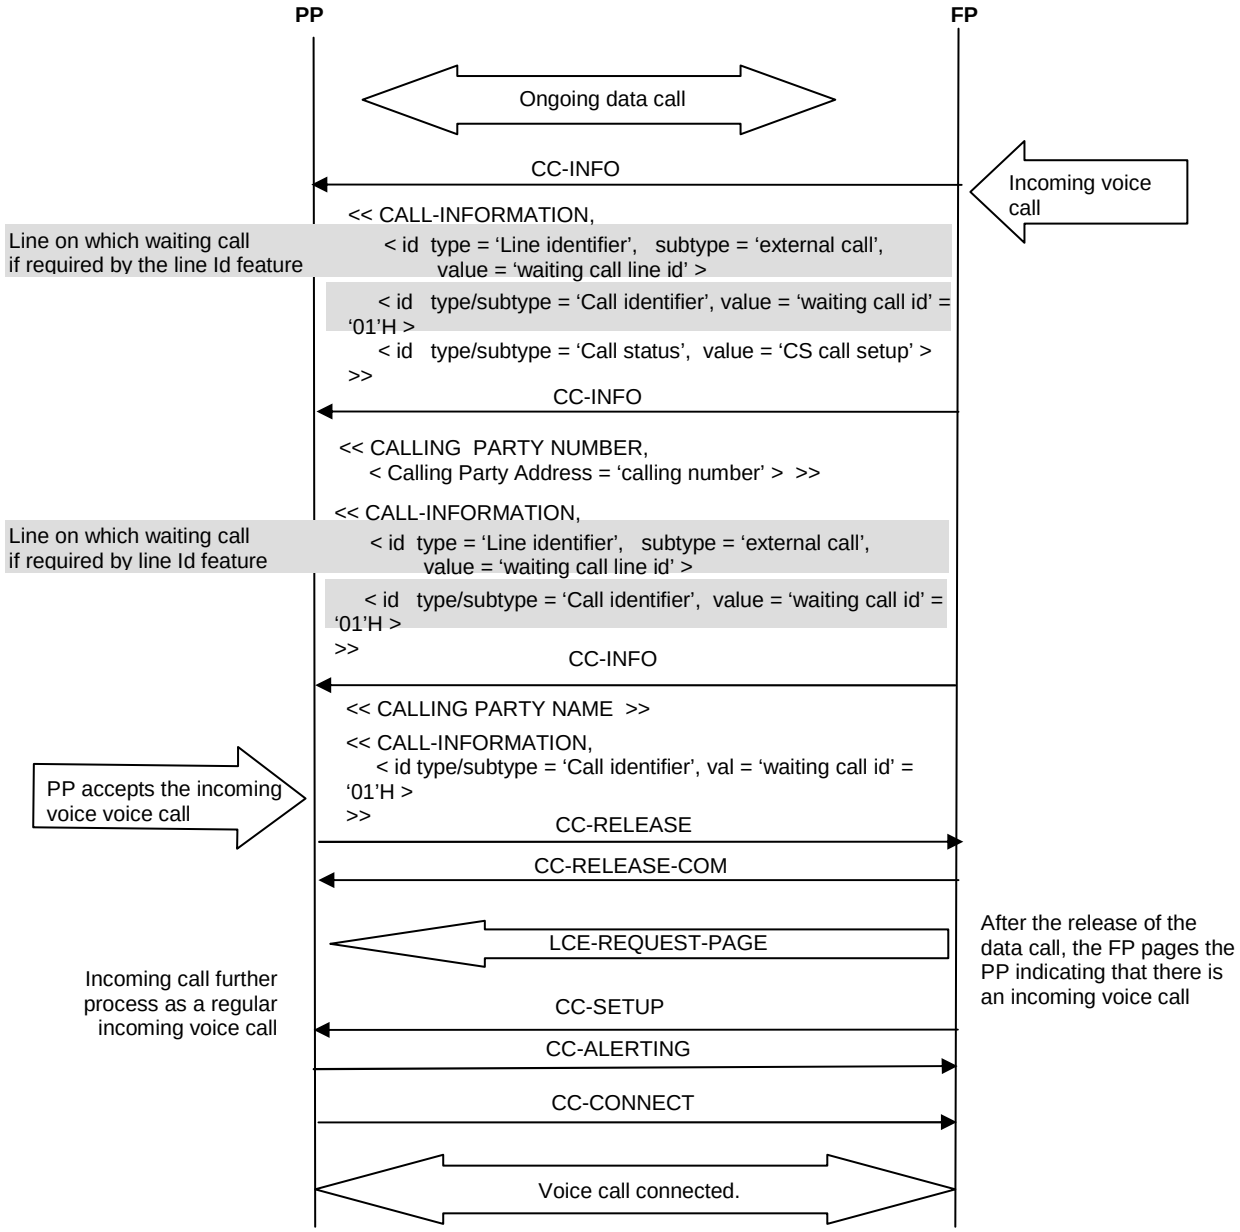

Figure 5: Incoming voice call accepted by the user during established data call

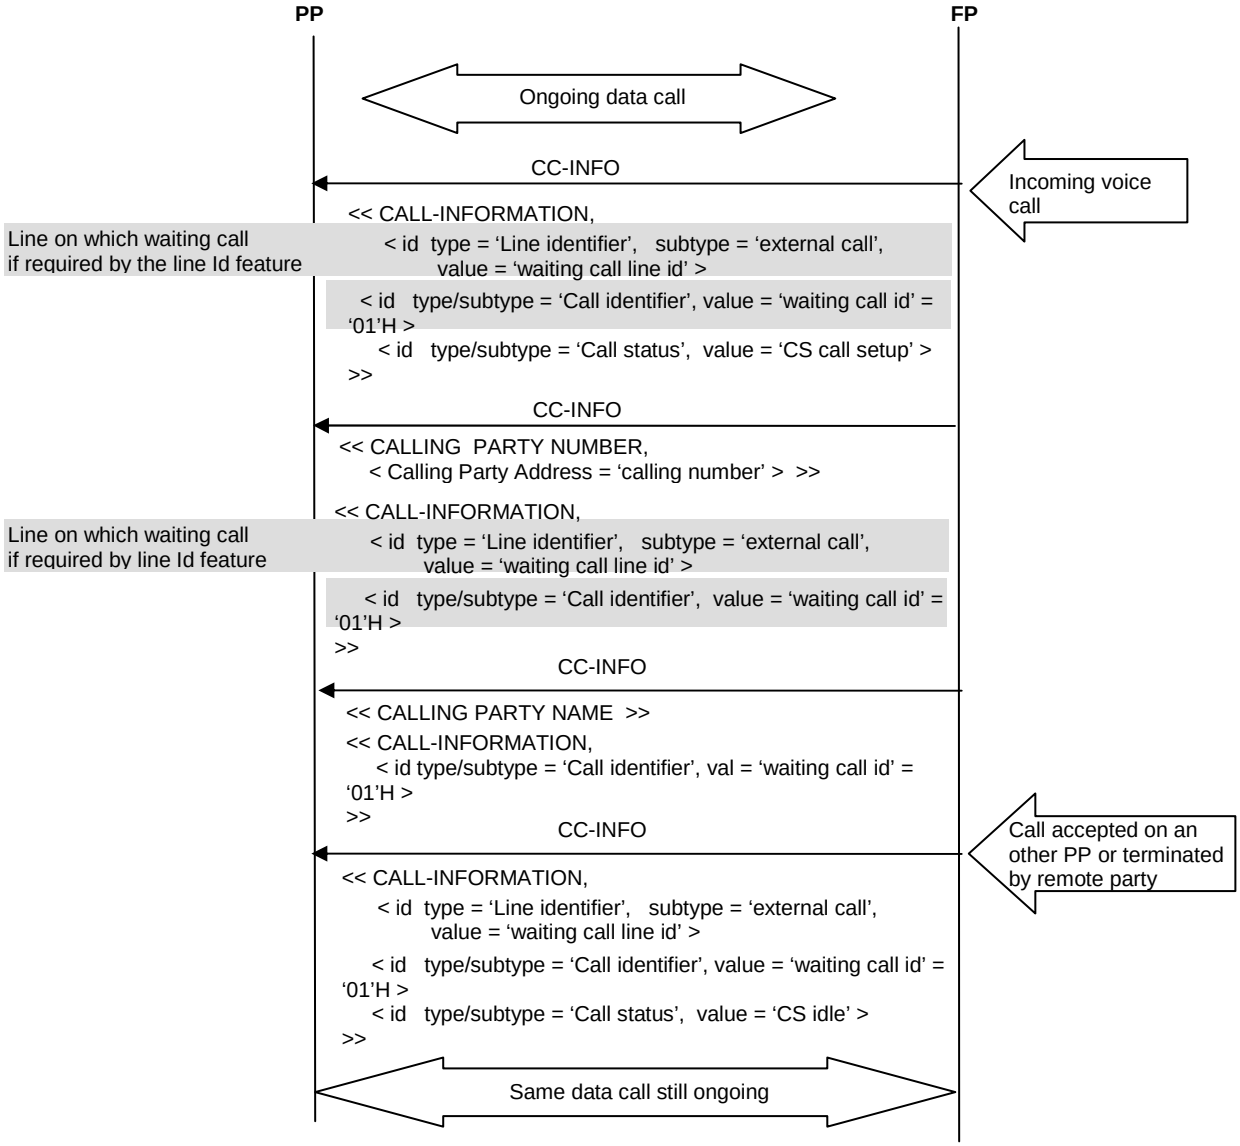

Figure 6: Incoming voice call during a data call but accepted on an other PP or terminated by remote party

Behaviour when there are several PPs in the cell

If there further PPs in the FP cell, not involved in a data call as described in the present document (either because they do not implement it, or because there is no active call), the regular procedures described in EN 300 444 [14] (GAP), TS 102 527-1 [16] or TS 102 527-3 [17] (as supported by the PP) shall be used with these PPs with no modifications.

If the FP is configured to page all, or several, PPs, when an incoming call arrives, the FP shall use the procedure described in the present clause for notifying the call to the PP (or PPs) that is(are) involved in a data call, and *simultaneously* shall use the standard LCE paging procedure (according to the voice profile supported) to notify all other PPs of the incoming call. The paging procedure for other PPs shall not be delayed waiting for the completion or response of the PP(s) which is(are) involved in the data call.

7.5.4.2.2 Simultaneous handling of light data service and voice calls

More advanced terminals (PP or FP) may implement the following procedures:

- Simultaneous handling of data and voice calls, but with only one active call at a time (the data call is suspended when the voice call is in progress).
- Systems supporting full simultaneous voice and data active calls (with simultaneous active bearers over the air interface).

The procedures for simultaneous handling of voice and data calls are for further study and will be added in future revisions of the present document.

7.5.4.2.3 Using a light data service when a voice call is already established

Initiating a light data service during established voice calls

When a voice call (internal or external) is already established, the PP and FP may exchange C-plane messages related to the SUOTA service.

If the FP does not support simultaneous voice and data calls (indicated in the << SETUP-CAPABILITY >> information element), the PP shall not start processing any data call, as there is no guarantee that the FP will support the voice call in parallel with the virtual call. In other words, the PP should always wait until the end of the voice call before establishing a virtual call intended for any light data service.

The procedure when the FP supports more enhanced behaviours (simultaneous voice and data calls), is left for future revisions of the present document.

SUOTA push mode notifications during a voice call

A FP implementing the SUOTA push mode procedure 7.5.6 may use an established voice call to send the generic event notification relating to the software upgrade indication

7.5.4.2.4 Handling of other interactions

Generic event notifications for telephony features while data service call is already established

For devices supporting NG-DECT part 3 (TS 102 527-3 [17]), Generic event notifications may be sent by using any established call or using the CLSS procedure. The FP may use the established data call for sending the notifications.

NOTE : if the data call is used for SUOTA and the PP is in upgrade process, the notification on PP side might be ignored.

Interactions with the "Call identification" feature ([NG1.N.13] of TS 102 527-3 [17])

If the "Call identification" feature ([NG1.N.13] of TS 102 527-3 [17]) is implemented on FP side, call identification is intended for voice calls only. More specifically no call identification shall be assigned by the FP at light data service setup.

7.5.4.3 Enforcement of encryption

7.5.4.3.1 Encryption of NG-DECT part 4 data calls

Use of encryption is mandatory in NG-DECT part 4 data transfer. Therefore all data calls shall be encrypted. The FT shall initiate the encryption as described in DPRS-N.17 feature.

7.5.4.3.2 Encryption of NG-DECT part 4 information exchange over C-plane

Additionally the transfer of any C-plane commands related to SUOTA should be encrypted, even if they are transported over an existing voice call, data call, service call or over CLSS.

- If the sending of the C-plane command is done by re-using an active link (data, voice or service call), the FT should initiate the encryption of the link for this call before sending the command.
- If the sending of the C-plane command is done using the CLSS procedure, the FT should start the encryption before the sending of the first {FACILITY} message.

NOTE : in terms of implementation, this may imply that any call has to be systematically encrypted or that the application waits until the end of a call and uses the CLSS procedure if the call was not originally encrypted. This may also imply that the FP starts encryption each time the CLSS procedure is used.

7.5.5 Information exchange in the C-Plane

Software upgrade uses C-plane message sequences and message formats to allow FT and PT to exchange information about software version and availability.

Information exchange in the C-Plane is based on the Information Element <<IWU to IWU>>. This is used in particular for the exchange of version information.

7.5.5.1 C-Plane commands general format

The C-plane commands are based on CISS {FACILITY} messages, which contain the Information Element <<IWU to IWU>>, using the dedicated protocol discriminator '06'H.

For the purpose of transmitting the {FACILITY} message containing the << IWU to IWU >> information element to the peer entity, the DECT entity shall either:

- use an already established link used by any Connection Oriented service (such as a voice, data or service call), if existing; or
- if there is no existing call at the time of sending the {FACILITY} message, use the CLSS procedure as defined in clause 10.4.2.3 of EN 300 175-5 [5]:
  - If the FT is the initiator, the FP shall initiate indirect link establishment as defined in clause 7.3.8 of TS 102 527-1 [16] "Indirect FT initiated link establishment" procedure. The short format and the full format with IPUI are allowed in the paging messages. The LCE header shall be set to either; the '000'B value (indicating "no U-plane") or to the '100'B value (indicating "General code for voice service").
  - If the PT is the initiator, the PP shall initiate direct link establishment as defined in clause 8.36 of EN 300 444 [14] "Direct PT initiated link establishment" procedure.
  - In both cases, full slot and long slot (j = 640) are allowed as slot type. The chosen slot type is decided by the initiating party.

Whatever {FACILITY} transport mode is used (re-use of an already established call, or use of the CLSS procedure), the {FACILITY} message shall be coded with the dummy transaction identifier (TI) value 6 and the protocol discriminator (PD) '0100'B for CISS.

The content of the IWU-to_IWU Information element carried in the {FACILITY} message shall be as described in table 18.

Table 18: General <<IWU to IWU>>-based software upgrade C-plane commands format

Information element	Field within the information element	Standard values within the field/IE	Normative action/comment
<<IWU to IWU>>			
	<Length of content>	L	Length of content (1 octet)
	<S/R bit>	1	Transmission of message
	<Protocol Discriminator>	06H	Software upgrade over the air
	<Command >	0…127	Software upgrade command
	<Command specific byte 0>		
	…		
	<Command specific byte L-2>		

7.5.5.2 Software upgrade commands

The following software upgrade commands are defined:

Bits 8 7 6 5 4 3 2 1	Meaning	PP => FP	FP => PP
0 0 0 0 0 0 0 0	handset version indication	YES	
0 0 0 0 0 0 0 1	handset version available		YES
0 0 0 0 0 0 1 0	URL indication	YES	YES
0 0 0 0 0 0 1 1	negative acknowledgement	YES	YES
All other values reserved			

7.5.5.2.1 "Handset version indication" command

The "Handset version indication" command allows a PP to check availability of a new software image (defined as a set of files, numbered from 1 to N_f, $N_f \leq 15$), and to request the urls targeting all of these files (one for each use of the command).

It is sent to the FP which sends the requested file url as a response, in a "Handset version available" command (see clause 7.5.5.2.2).

Decision to send a "Handset version indication" command shall be taken by the PP according to the provisions of clause 7.6.2.2.1, "Step 1-PP sends a "Handset version indication" command to the FP. The PP shall not queue several "Handset version indication" commands.

The URL following this command (see octet 7), if present, shall contain a valid URL1 value to be used in step 2 (see clause 7.6.2.2.2, "Step 2-FP retrieves url of the next file to be downloaded (FP_URL2)").

Bit:	8	7	6	5	4	3	2	1	Octet:
0	<< IWU-TO-IWU >>								1
Length of Contents (L = LS + LH + 11)									2
1	S/R = 1	**Protocol Discriminator = "Software upgrade over the air" = '06'H**							3
0/1 ext	**Command = "Handset version indication" = '0'H**								4
EMC value high byte									5
EMC value low byte									6
URL1 to follow									7
0	reserved					**fileNumber**			8
0/1 ext	**flags**					**reason**			8a
<SW Version identifier> = 1									9
Length of SW Version identifier (1 ≤ LS ≤ 20)									10
SW Version identifier first octet (IA5 character)									11
…									…
SW Version identifier last octet (IA5 character)									LS + 10
<HW Version identifier> = 2									LS + 11
Length of HW Version identifier (1 ≤ LH ≤ 20)									LS + 12
HW Version identifier first octet (IA5 character)									LS + 13
…									…
HW Version identifier last octet (IA5 character)									LS + LH + 12

Figure 7: <<IWU-TO-IWU>> information element for the "Handset version indication" command

Equipment Manufacturer's Code (EMC)

Equipment Manufacturer's Code 16-bit value, as defined in EN 300 175-6 [6].

URL1 to follow (URL1_to_follow) (octet 7)

Bits 8 7 6 5 4 3 2 1	Meaning
0 0 0 0 0 0 0 0	URL does not follow
0 0 0 0 0 0 0 1 to 1 1 1 1 1 1 1 1	Number of URL messages following in a "URL indication" command

If present, URL1 value shall follow in one or several "URL indication" commands (see clause 7.5.5.2.3).

File number field (fileNumber = "n") (octet 8)

Interpretation of the fileNumber field depends on the reason field value.

- If the reason field is "0", fileNumber is the ordinal number of the requested file. This implies that files with number between 1 and fileNumber-1 where applied successfully.
- If the reason field is not "0", the "fileNumber" field refers to the file number of the file whose application failed.

Reason field (reason) (octet 8a)

The interpretation of the "Handset version indication" command depends on the reason field value:

- when the "reason" field is "0", the command is a request for a new file, as described in clause 7.6.2.2.1.
- when the "reason" field is non zero, the command is a notification of failure, as described in clause 7.6.2.6.

NOTE 1: The meaning of the "fileNumber" field also depends on the "reason" field value. See "File number field" description.

Bits 4 3 2 1	Meaning
0 0 0 0	Success of previous files application. Request for a new file (indicated by "fileNumber" field)
0 0 0 1	Download of file with indicated fileNumber failed
0 0 1 0	Application of file with indicated fileNumber failed
0 0 1 1	Unable to download in time-New DelayMinutes requested (see clause 7.5.5.2.2, DelayMinutes field for details)

All other values reserved.

NOTE 2: Application of a file refers to the intended use of the file during installation of the new software, and until the next file is requested.

Flags (octet 8a)

Bits 7 6 5	Meaning
x x 1	User initiated software upgrade

Bits 6 and 7 are reserved for further standardization. They shall be set to "0".

SW Version identifier (octet 9)

A field identifier value of "1" shall be used in octet 9. PP *current* software version identifier. The length of this parameter shall be of 20 octets maximum. Only IA5 characters shall be used.

The SW version identifier value is software provider specific, and shall be defined by the PP vendor. It shall not be empty. The value used shall represent the currently installed version of the software, not the targeted SW version identifier (although it is known from the first response of the FP on).

The field value shall be set to a value allowing the MS to determine the software identity and version to be downloaded (not only the version, unless the software identity is implicit). Examples of field values:

- SW Version identifier ="FIRMWARE-1.2.0".
- SW Version identifier ="WEATHER-WIDGET-1.2.0".
- SW Version identifier ="1.2.0".

NOTE 3: The FP should not interpret this value and should always rely on the management server response to get the new software version identifier documented in the "Handset version available" command.

NOTE 4: In case the SUOTA feature is used for a software **first** installation (i.e. not for an "upgrade"), a special value of the field should be defined to indicate this (i.e. the initial software version identifier cannot be used as it is not the currently installed version).

HW Version identifier (octet L_H + 11):

A field identifier value of "2" shall be used in octet L_H + 11. PP hardware version identifier. The length of this parameter shall be of 20 octets maximum. Only IA5 characters shall be used.

This value does not change during the whole lifecycle of the PP.

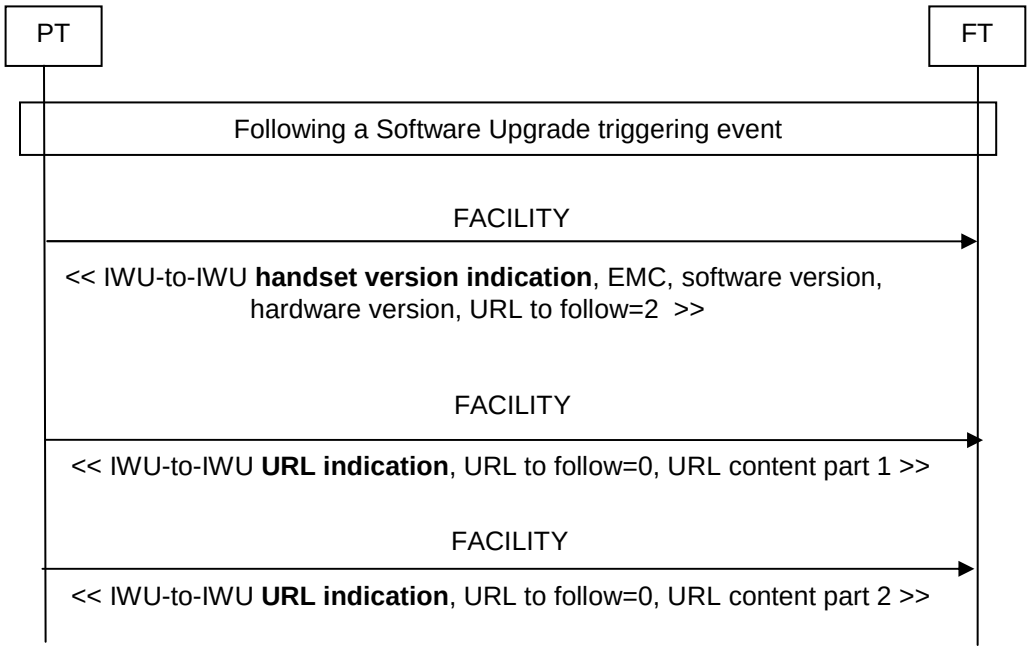

Figure 8: "Handset Version indication" procedure

NOTE 5: "URL indication" command is described in clause 7.5.5.2.3.

A handset software version is clearly identified by the parameters EMC, SW Version identifier, and HW Version identifier, which can be used by the management server to assign a new software image.

7.5.5.2.2 "Handset version available" command

Bit:	8	7	6	5	4	3	2	1	Octet:
	0	<< IWU-TO-IWU >>							1
	Length of Contents (L = Ls + 8)								2
	1	S/R = 1	**Protocol Discriminator = "Software upgrade over the air" = '06'H**						3
	0/1 ext	**Command = "Handset version available" = '1'H**							4
	DelayMinutes value high byte								5
	DelayMinutes value low byte								6
	URL2 to follow								7
	0/1 ext	**User interaction**			reserved				8
	<**SW Version identifier**> = 1								9
	Length of SW Version identifier (0 ≤ Ls ≤ 20)								10
	SW Version identifier first octet (IA5 character)								11
	…								…
	SW Version identifier last octet (IA5 character)								Ls + 10

Figure 9: <<IWU-TO-IWU>> information element for the "Handset version available" command

Delay for download in minutes (DelayMinutes) (octets 5 and 6)

Delay in minutes, starting from current time (i.e. from reception of the "Handset version available" command), to be respected by the PP until the actual software image download can start.

This delay allows the MS:

- to avoid server overload by distributing downloads over time;
- to minimize user disturbance, by differing downloads until the next night;
- to schedule distinct software upgrades to the same PP (each with its own set of files).

A value of "0" indicates that an immediate download is required by the MS.

A value of "FFFF"H indicates that the delay is undefined (the PP may attempt a download at any time).

First file download: The delay is especially significant for the first file (when fileNumber = "1" in the PP request). The PP shall respect the indicated delay as a lower bound and shall try to immediately download the software after the delay has timed out.

More specifically, the download of the first file shall start as soon as possible after CurrentTimeMinutes + DelayMinutes, where CurrentTimeMinutes refers to the reception time in minutes of the request (from any time origin).

Next files download: For the next files (fileNumber $\geq$ 2), and provided the PP does not ask for a new delay (see below), the FP shall set the DelayMinutes parameter to "0", so that the overall upgrade time will be as short as possible.

Possible request for a new delay: If the PP cannot respect the delay for a file (the first file, or any file), e.g. if the PP was switched off or the server was unreachable when the delay timed out, the behaviour of the PP is left up to the PP vendor. For example:

- the PP may try to download the software anytime afterwards;
- or, the PP may respect a build-in download window. More specifically in that case:
  - the PP will not try to download the current file after CurrentTimeMinutes + DelayMinutes + DownloadWindowMinutes, where DownloadWindowMinutes represents the built-in download window length for downloading;
  - additionally, if the download window cannot be respected, the PP asks for a new DelayMinutes value (hence a new download window), using the "reason" field value of "Unable to download in time-New DelayMinutes requested" (see clause 7.5.5.2.1), in order to be able to download the remaining (or all) files.

NOTE: In case of firmware upgrade, a PP may request a new download window while keeping some already downloaded files in the following cases:

- because it has sufficient memory to keep them while still being functional;
- or because it can no longer revert to a working version (but only a rescue version only allowing firmware upgrade).

URL2 to follow (URL2_to_follow) (octet 7)

Bits	**8 7 6 5 4 3 2 1**	**Meaning**
	0 0 0 0 0 0 0 0	URL does not follow
	0 0 0 0 0 0 0 1	
	to	Number of URL messages following in a "URL indication" command
	1 1 1 1 1 1 1 1	

If present, URL2 value shall follow in one or serveral "URL indication" commands (see clause 7.5.5.2.3).

User interaction (octet 8)

Bits	7 6 5	Meaning
	0 0 0	No user interaction required
	0 0 1	User interaction required
	0 1 0	User interaction undefined

All other values reserved.

This field allows the MS to indicate wheter a user interaction is required or not before the actual download of the software can take place. Value '010'B indicates that there is no MS requirement concerning user interaction.

SW Version identifier (octet 9)

A field identifier value of '1' shall be used. Software version identifier of the software to be installed as a result of the upgrade (not the currently installed version). The length of this parameter shall be of 20 octets maximum. Only IA5 characters shall be used.

If a new software version is available, this field shall not be empty (the length shall not be '0') in order to allow future upgrades. An empty "software version identifier" (length = 0) shall be used if there is no new version available.

The SW version identifier value is software provider specific, and shall be agreed with the MS operator.

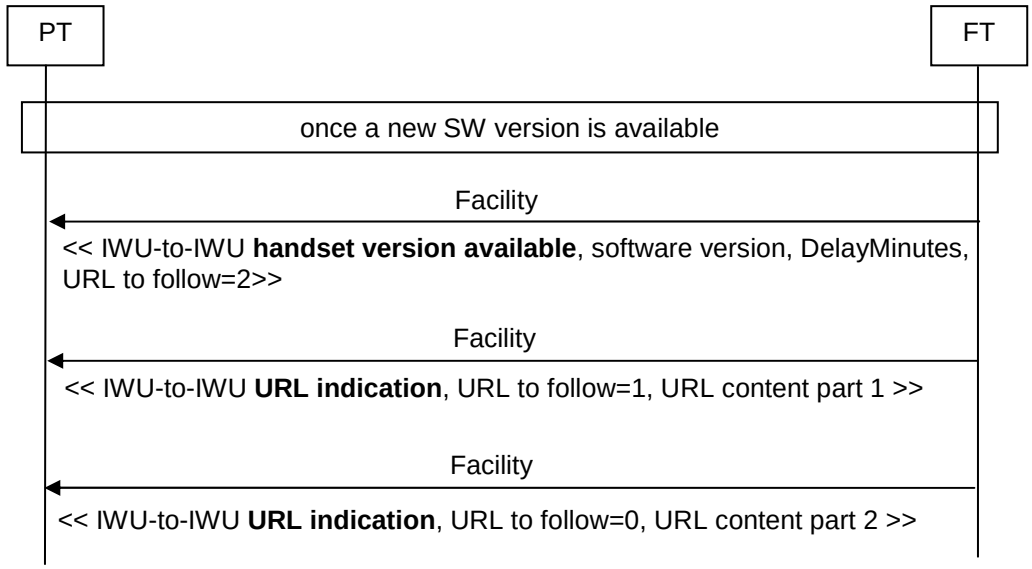

Figure 10: "Handset Version available" procedure

NOTE: "URL indication" command is described in clause 7.6.2.4.2.3.

7.5.5.2.3 "URL indication" command

Bit:	8	7	6	5	4	3	2	1	Octet:
0	<< IWU-TO-IWU >>								1

URL to follow									5
Length of URL content in this IE (Lu)									6
URL content first octet (IA5 character)									7
…									…
URL content last octet (IA5 character)									Lu + 6

Figure 11: <<IWU-TO-IWU>> information element for the "URL indication" command

URL to follow (URL_to_follow) (octet 5)

Bits	**8 7 6 5 4 3 2 1**	**Meaning**
	0 0 0 0 0 0 0 0	This message is the last message and contains the last part of the URL
	0 0 0 0 0 0 0 1 to 1 1 1 1 1 1 1 1	Number of remaining "URL indication" messages following this message

7.5.5.2.4 "Negative acknowledgement" command

The "negative acknowledgment" command is used by the FP or the PP for notifying errors arising during the use of C-plane software upgrade commands.

NOTE 1: The allowed directions of use depend on the "Reject reason" field value.

It shall not be used to notify errors arising from the use of "Binary content download" feature over the U-plane, when downloading the software image.

Table 19: Values used within <<IWU to IWU>> information element for the "negative acknowledgement" command

Information element	Field within the information element	Standard values within the field/IE	Normative action/comment
<<IWU to IWU>>			
	<**Length of content**>	LH	Length of content
	<**Protocol Discriminator**>	06H	Software upgrade
	<**Command**=negative acknowledgement >	03H	Software upgrade command
	<**Reject reason**>	0...255	Reject Reason

Reject reason

Bits	**8 7 6 5 4 3 2 1**	**Meaning**	**Direction**
	0 0 0 0 0 0 0 0	Reserved	both
	0 0 0 0 0 0 0 1	Retry later - Connection refused (see note 2)	FP to PP
	0 0 0 0 0 0 1 0	Retry later - FP resources overflow (see note 2)	FP to PP
	0 0 0 0 0 0 1 1	File does not exist (see clause 7.6.2.2.3, option 3)	FP to PP
	0 0 0 0 0 1 0 0	Invalid URL1 format	FP to PP
	0 0 0 0 0 1 0 1	Unreachable URL1 (server error)	FP to PP
	0 0 0 0 0 1 1 0	Command format error	both

all other values reserved.

NOTE 2: The "Retry later" error code may be used in case the FP is faced with several simultaneous upgrade requests (using the "handset version indication" command) from several PPs, which it cannot handle simultaneously.

The "Retry later - Connection refused" value shall be used in case an additional connection cannot be setup by the FP with this PP.

The "Retry later - FP resources overflow" value shall be used in case the PP connection was accepted but the remaining hardware resources are not sufficient to handle the upgrade.

7.5.6 SUOTA push mode

A FP implementing the present procedure shall use the "generic event notification" procedure of TS 102 527-3 [17], clause 7.4.1, to forward software upgrade indications to the PP.

The <<CALL-INFORMATION>> information element shall not be sent as part of this notification.

For indication of values used in <<Events notification>> information element, see table 20.

Table 20: Values used within {FACILITY} message for software upgrade indication

Information element	Field within the information element	Standard values within the field/IE	Normative action/comment
<<Events notification>>	<Event type>	4	Software upgrade indication
	<Event sub type>	0 or 1	0 Unknown 1 Firmware upgrade
	<Event multiplicity >	0	Not used. Shall have a value of "0"

A PP implementing the present procedure should attempt a Software upgrade Over The Air (see clause 7.6.2) when receiving the notification. However, the PP exact behaviour is left up to the PP vendor. More specifically, a "Handset Version Indication" command could be sent anytime afterwards, or not be sent at all.

EXAMPLE 1: A PP could respect a built-in timeout, and send a "Handset Version Indication" command as described in clause 7.6.2.2.1 only if it has the opportunity to do so within this timeout, and ignore the notification otherwise.

EXAMPLE 2: A PP could respect a delay between the sending of two consecutive "Handset Version Indication" commands for security reasons, forcing it not to respect the built-in timeout.

EXAMPLE 3: A PP could ignore notifications transferred from a FP from a different vendor, from a blacklisted FP, etc.

7.5.7 Terminal capability indication

The contents of the <Terminal Capability> information elements shall be based on the requirements of EN 301 649 [15], clause 12.3.

For the purpose of this ASAP only the status of the fields and specific values implementation that **has changed** is indicated in this clause. For the rest whatever specified in EN 301 649 [15] shall apply.

Table 21: Values used within the <<TERMINAL CAPABILITY>> information element

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<<Terminal capability>>			
	<ext4>	0	
	<Profile indicator_1>	'x 1 x x x x'B	OUT OF SCOPE (DPRS Stream support)
		'1 x x x x x'B	OPTIONAL (Asymmetric bearer)
	<ext4a>	0	
	<Profile indicator_2>	'x x x x x 1'B	OPTIONAL(DPRS Class 2 management and B-field procedures (DPRS-M.5) supported (EN 301 649 [15])
	<ext4b>	0	
	<Profile indicator_3>	'x 1 x x x x'B	OUT OF SCOPE (Ethernet support)
		'1 x x x x x'B	OUT OF SCOPE (Token Ring support)
	<ext4c>	0	
	<Profile indicator_4>	'x x x x x 1'B	OUT OF SCOPE (IP support)
		'x x x x 1 x'B	OUT OF SCOPE (PPP support)
		'x x x 1 x x'B	OUT OF SCOPE (V.24 support)
		'x x 1 x x x'B	OPTIONAL (C_F supported)
		'x 1 x x x x'B	OPTIONAL (I_{PQ} services supported)
		'1 x x x x x'B	MANDATORY (Generic Media Encapsulation supported)
	< ext4d >	0	
	< ext4e >	0	
		'x 1 x x x x'B	OPTIONAL (Channel G_F supported, see note 2)
		'x 1 x x x x'B	OPTIONAL (PT with fast hopping radio)
		'1 x x x x x'B	OPTIONAL (Capability to support "no emission" mode (see EN 300 175-3 [3], clause 9.4)
	< ext4f >	0	
	< ext4g >	0	
		'x x x x x 1'B	OPTIONAL (E+U-type mux and channel I_{PF} basic procedures supported, see note 1)
		'x x x x 1 x'B	OPTIONAL (Channel I_{PF} advanced procedures supported)
		'x x x 1 x x'B	OUT OF SCOPE (Channel SI_{PF} supported)
	<Packet data category>	any	OUT OF SCOPE of the present document. System may be categorized due to other data capabilities. If not categorized, code shall be set as 0.
	< ext4h >	1	
		'x x x x x 1'B	OPTIONAL (DPRS Class 3 management and A-field procedures (DPRS-M.30) supported (see EN 301 649 [15],)
		'x x x x 1 x'B	MANDATORY (DPRS Class 4 management and A-field procedures (DPRS-M.30) supported (see EN 301 649 [15])
		'x 1 x x x x'B	MANDATORY (Support of Light data services (the present document)
NOTE 1: IF DPRS-M.23 THEN MANDATORY ELSE OPTIONAL. NOTE 2: IF DPRS-M.19 THEN MANDATORY ELSE OPTIONAL.			

7.5.8 Call resources/parameters negotiation

The contents of the messages applicable to this procedure shall be based on the requirements of the EN 301 649 [15], clause 12.5, with the fields and values listed in table 22.

Table 22: Values used within the {CC-SETUP} message

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<< IWU attributes >>			
	< Length of Contents >	any	
	< Coding standard >	01	Profile defined coding.
	< Profile >	00000	DPRS Frame Relay support (MANDATORY)
	< Negotiation Indicator >	000, 010	- Negotiation not possible (see note 1). - Peer attribute negotiation.
	< Profile Subtype > (octet 4)	1 000	DECT Generic media encapsulation (MANDATORY, Other options Out of scope)
	<Maximum SDU size> PT => FT (octets 5 and 5a)	> 191 (equivalent to 1 528 octets)	At least 1 528 octets (codec as 191) shall be supported (see note 7)
	<Maximum SDU size> FT => PT (octets 5b and 5c)	> 1 528 (equivalent to 12 224 octets)	At least 12 224 octets (codec as 1 528) shall be supported (see note 7)
	< Profile Subtype attributes> (octet 6)	several values and number of octets possible	See DPRS [15], clauses B.2 and B.8
<< Call attributes >>			
	< Coding standard >	00	
	< NWK layer attributes >	00010, 00011, 00110	DPRS Class 2, DPRS Class 3, DPRS Class 4. Only values for implemented ME Classes need to be supported.
	< C-plane class >	010	Class A shared is only mandatory, rest are optional and need not be supported by the peer side.
	< C-plane routing >	0000, 0100	C_S only; C_F only; Support of C_F is optional.
	< ext5 >	1	
	< U-plane symmetry >	00	Symmetric (see note 6).
	< LU identification >	01010	LU10.
	< ext6 >	1	
	< U-plane class >	101	Class 2; SELective.
	< U-plane frame type >	1010	FU10a/c mandatory for support.
<< Connection attributes >>			Signifies the maximum capabilities of the sender for the requested call. If not included the default value shall be assumed (see clause 12.5.1 of [15]).
	< Symmetry >	001 010 101	Symmetric only connection Asymmetric reversible Asymmetric one-way-only Asymmetric types are applicable only when operating in ME Class 2 and B-field signalling (DPRS-M.5).
	< Connection identity >	0000	Not yet numbered.
	ext4	0, 1	If 1 is indicated, the octets 4a, 4b and 4c shall not be included and their values shall be understood to be equal to the value set in < Target bearers (P = > F direction) >.
	< Maximum bearers (P = > F direction) >	00nnnnn nnnnn = 1 to 23	If "Symmetric" has been indicated max. value that needs to be supported is 12.

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
	ext4a	0, 1	If 1 is indicated, the octets 4b and 4c shall not be included and their values shall be understood to be equal to the values set in octets 4 and 4a respectively.
	< Minimum bearers (P = > F direction) >	01nnnnn nnnnn = 0 to 23	
	ext4b	0, 1	If 1 is indicated, the octets 4c shall not be included and its value shall be understood to be equal to the value set in octet 4b.
	< Maximum bearers (F = > P direction) >	10nnnnn nnnnn = 1 to 23	
	ext4c	1	
	< Minimum bearers (F = > P direction) >	11nnnnn nnnnn = 0 to 23	
	< ext5 >	0, 1	If 1 is indicated, octet 5a shall not be included and its value shall be understood to be equal to the value set in octet 5.
	< MAC slot size >	001 100 101	long slot 640 MANDATORY to support full slot Optional to support double slot Optional to support
	< MAC service P = > F >	0010 0011 0110 0111	I_{PM}; detect: MANDATORY to support I_{PMR}; Mod-2 correct: Optional I_{PQ}; detect: optional I_{PQR}; Mod-2 correct: Optional Support of "I_P; Mod-2 correct" and I_{PQ} is optional
	< ext5a >	1	
	< spare >	000	
	< MAC service F = > P >	0010 0011 0110 0111	I_{PM}; detect: MANDATORY to support I_{PMR}; Mod-2 correct: Optional I_{PQ}; detect: optional I_{PQR}; Mod-2 correct: Optional Support of "I_P; Mod-2 correct" and I_{PQ} is optional
	< Ext6 >	1, 0	If 1 is indicated, octet 6a shall not be included and its value shall be understood to be equal to the value set in octet 6.
	< C_F channel attributes P = > F >	000, 010, 011, 100, 101	C_F never (C_S only) C_F priorities A, B, C or D Support of C_F is optional.
	< MAC packet life time P = > F >	0 to 7	Values > 0 only for I_P_error_correct.
	< Ext6a >	1	
	< C_F channel attributes F = > P >	000, 010, 011, 100, 101	C_F never (C_S only) C_F priorities A, B, C or D Support of C_F is optional.
	< MAC packet life time F = > P >	0 to 7	Values > 0 only for I_P_error_correct or I_{PQ}_error_correct.
	< Ext7 >	1	See note 5.
	< A-attributes >	000	2-level modulation scheme
	< B-attributes >	000, 001, 010	2-level modulation scheme 4-level modulation scheme 8-level modulation scheme The support of 4 and 8 level modulation scheme is optional.

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<< Transit delay >>			For the default value in case it is not included see clause 12.5.1 of [15].
	< Forward Delay >	0 All	Infinite - Mandatory for support Rest - optional.
	< Backward Delay >	0 All	It is not required to support different values in Backwards direction.
<< Window size >>			(See note 2) For the default values if not included see clause 12.5.1 of [15].
	ext3	0	
	< Window size value (forward) >	All	The value shall be placed in both 3 and 3a octets as defined in EN 300 175-5 [5], clause 7.7.43 (for the range of allowed values see clause 11.1.1 of [15]). Maximum allowed for this profile value = 256. (see note 3)
	ext3a	1	
	< Window size value (forward) continue >	All	
	ext4	0	
	< Window size value (backward) >	All	The value shall be placed in both 3 and 3a octets as defined in EN 300 175-5 [5], clause 7.7.43 (for the range of allowed values see clause 11.1.1 of [15]). Maximum allowed for this profile value = 256.
	ext4a	1	
	< Window size value (backward) continue >	All	

NOTE 1: This value may only be used if all other parameters have values equal to the default values (see clause 12.5.1 of [15]).
NOTE 2: If octet group 4 (i.e. 4, 4a, 4b) is omitted the values defined in Octet group 3 apply for both directions.
NOTE 3: The values introduced in clause 11.1.1 of [15] need to be respected in all window-size fields.
NOTE 4: The direction of the connection downlink (FT-to-PT) or up-link (PT-to-FT) will be dynamically negotiated at MAC layer.
NOTE 5: For backwards compatibility, if octet 7 is not included support of 2-level modulation scheme for both A- and B-field shall be assumed.
NOTE 6: If "Symmetric" is indicated octets 4b, 4c, 5a and 6a need not to be included.
NOTE 7: Value 191 (equivalent to 1 528 octets) is codec as '0000001'B in octet 5 and '0111111'B in octet 5a.

7.5.9 IWU-attributes change

The contents of the messages applicable to this procedure shall be based on the requirements of the EN 301 649 [15], clause 12.7.

For the purpose of this ASAP only the status of the fields and specific values implementation that **has changed** is indicated in this clause. For the rest whatever specified in EN 301 649 [15] shall apply.

Table 23: Values used within the {CC-SERVICE-CHANGE} message

Information element	Field within the information element	Standard values within the field/information element	Normative action/comment
<<IWU attributes>>			
	<Profile>	00001	OUT OF SCOPE (Stream support)
		00000	MANDATORY (FREL support)
	<Profile Subtype>	0000	OUT OF SCOPE (IEEE 802.3 [i.8] / Ethernet (WLAN))
		1000	OUT OF SCOPE (Interworking to V.24 circuits (RS232)
		0001	OUT OF SCOPE (IEEE 802.5 [i.9], (clause B.5))
		0010	OUT OF SCOPE (Internet Protocol (IP) (clause B.6 (RFC 791 [19]))
		0100	OUT OF SCOPE (Point-to-Point Protocol (clause B.7 (RFC 1661 [i.10]))
		1000	MANDATORY (Generic Media Encapsulation Protocol (clause B.8))

7.5.10 Broadcast attributes management

The contents of the messages applicable to this procedure shall be based on the requirements of the EN 301 649 [15], clause 12.16.

For the purpose of this ASAP only the status of the fields and specific values implementation that **has changed** is indicated in this clause. For the rest whatever specified in EN 301 649 [15], shall apply.

Table 24: Extended higher layer capabilities interpretation by the PP

BIT Number	Attribute	Value	Note
a27	Generic Media Encapsulation	1	MANDATORY
a29	Ethernet	x	OUT OF SCOPE
a30	Token Ring	x	OUT OF SCOPE
a31	IP	x	OUT OF SCOPE
a32	PPP	x	OUT OF SCOPE
a33	V.24	x	OUT OF SCOPE
a45	DPRS Class 3 or Class 4 management and A-field procedures supported (DPRS-M.30),	1	MANDATORY (see note)
a46	DPRS Class 2 management and B-field procedures supported (DPRS-M.5)	0,1	OPTIONAL (IF DPRS-ME.2 THEN "1" ELSE "0").
NOTE: The supported management Class is inferred from the state of bit a21 (MAC suspend/resume supported). If bit a21= 1 then Class 3, if a21 is = 0, then Class 4.			

Table 25: Extended higher layer capabilities part 2 interpretation by the PP

BIT Number	Attribute	Value	Note
< a25 - a28 >	NG-DECT Packet Data Category	any	Irrelevant for the present specification. System may be categorized due to other data capabilities
a35	no-emission mode support	0,1	OPTIONAL
a45	Light data services (TS 102 527-4) supported	1	MANDATORY

7.6 Application layer procedures

The procedures as specified in EN 301 649 [15], clause 12 shall apply with the modifications and additional procedures listed in the present clause.

7.6.1 Binary content download

7.6.1.1 Binary content download general requirements

The "Binary content download" feature allows the design of "PP to server" distributed applications (see the definition below), based on HTTP, and usable with any Part 4 FP.

NOTE 1: "Binary" refers to DECT layers transparency toward the type of files being transmitted to the PP.

Distributed application. A distributed application is an application available to the user on a DECT handset, for which part of the code (behaviour) and/or data is located on the handset (local tier) and part of it is located in the network (remote tier). The remote tier may consist in one or more HTTP servers.

There is a strong relationship between the local and remote tiers of the application, so that the PP and servers are assumed to be designed in a compatible manner.

NOTE 2: This feature may be used with several possible design structures: HTTP servers hosted by the PP manufacturer, or PP vendor, or other parties.

For interoperability reasons, the remote tier of a pure binary content download application should not be hosted on the FP.

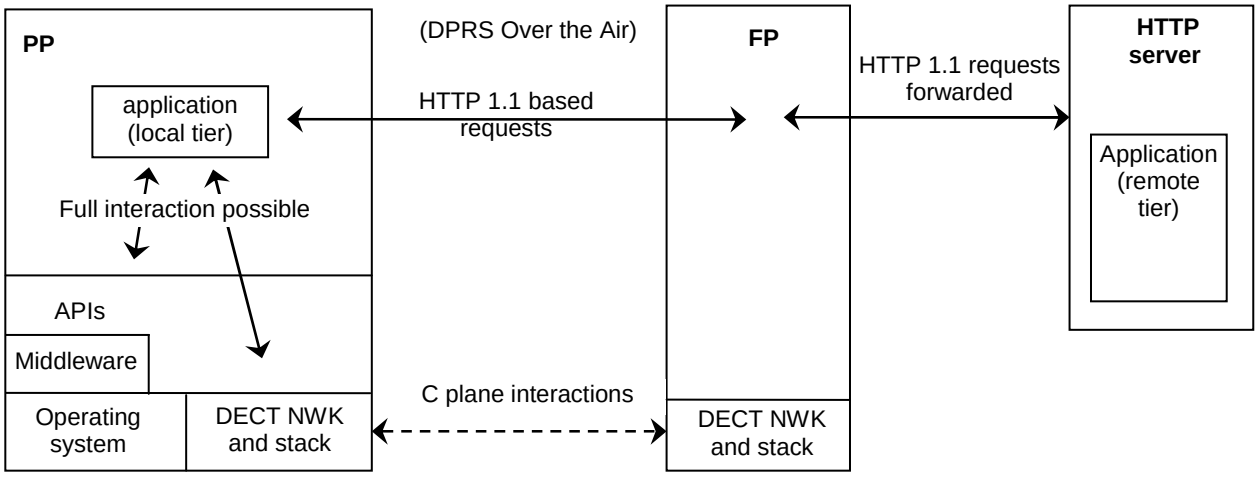

Figure 12: Distributed application using "Binary content download"

7.6.1.2 LU10 interworking conventions and HTTP profile

7.6.1.2.1 LU10 interworking conventions and HTTP profile for "Simple binary content download"

For the "Simple binary content download" procedure, a file transfer shall occur in the U-Plane based on a single context of HTTP protocol, transported over DPRS Generic Interworking Encapsulation Protocol (DPRS [15], clause B.8).

The following specific provisions related to Generic Media Encapsulation shall apply:

- HTTP limited set nr. 2 as described in DPRS (EN 301 649) [15], clause B.8.3.4 shall be used.
- HTTP limited set nr. 2 includes:
  - support by both the PP and FP of the HTTP partial GET method (see note);
  - support by the PP of the media type "application/octet-stream" at least;
  - support of a limited set of HTTP headers.

NOTE: A partial GET is characterized by the presence of a "Range" header in an HTTP GET request. Presence of this header is mandatory for all GET requests between the PP and the FP (as described in the "Common HTTP profile"), even if a whole resource is requested.

- HTTP limited set nr. 3 as described in DPRS (EN 301 649) [15], clause B.8.3.5 may optionally be used.
- Protocol identifier code 1079 (or 1077 if limited set nr. 3) shall be used or assumed in IE <<IWU-Attributes>> control octets.
- Basic services "light data service with Class 4 DPRS management" (code '1001'B) OR "light data service with Class 3 DPRS management" (code '1010'B) shall be used.
- The simplified single-context Interworking procedure described in DPRS [15], clause B.8.4.3 shall be used.

7.6.1.2.2 LU10 interworking conventions and HTTP profile for "Enhanced binary content download"

For the "Enhanced binary content download" procedure, a file transfer shall occur in the U-Plane based on one or several contexts of HTTP protocol, transported over DPRS Generic Interworking Encapsulation Protocol (DPRS [15], clause B.8).

The following specific provisions related to Generic Media Encapsulation shall apply:

- HTTP limited set nr. 2 as described in DPRS (EN 301 649) [15], clause B.8.3.4 shall be used.
- HTTP limited set nr. 3 as described in DPRS (EN 301 649) [15], clause B.8.3.5 may optionally be used.
- HTTP limited set nr. 2 includes:
  - support by both the PP and FP of the HTTP partial GET method (see note).
  - support by the PP of the media type "application/octet-stream" at least.
  - support of a limited set of HTTP headers.

NOTE: A partial GET is characterized by the presence of a "Range" header in an HTTP GET request. Presence of this header is mandatory for all GET requests between the PP and the FP (as described in the "Common HTTP profile"), even if a whole resource is requested.

- Protocol identifier code 1079 shall be used or assumed in IE <<IWU-Attributes>> control octets. Protocol code 1077 may be used.

  Basic services "light data service with Class 4 DPRS management" (code '1001'B) OR "light data service with Class 3 DPRS management" (code '1010'B) shall be used.

- The multi-context Interworking to an application proxy procedure described in DPRS [15], clause B.8.4.2 shall be used.
- The feature DPRS-N.35 (Service change) shall be supported.

7.6.1.2.3 LU10 interworking conventions and HTTP profile for "Generic multiprotocol binary content download"

For the "Generic multiprotocol binary content download" procedure, a file transfer shall occur in the U-Plane based on one or several contexts of HTTP protocol, transported over DPRS Generic Interworking Encapsulation Protocol (DPRS [15], clause B.8).

The following specific provisions related to Generic Media Encapsulation shall apply:

- All implementations shall support at least the following protocols:
  - HTTP limited set nr 2.as described in DPRS (EN 301 649) [15], clause B.8.3.4 (protocol code 1079).
  - Full HTTP as RFC 2616 [22] (protocol code 80).
  - DNS as RFC 1034 [25] and RFC 1035 [26] (protocol code 53).
  - Any other protocol transportable over TCP or UDP may be also supported.. The HTTP limited set nr 1 as described in DPRS (EN 301 649) [15], clause B.8.3.3 (protocol code 1078) and the HTTP limited set nr.3 as described in DPRS (EN 301 649) [15], clause B.8.3.5 (protocol code 1077) may also be supported.
- The proper protocol identifier codes according to the rules of DPRS [15], clause B.3.1 shall be used.
- Basic services "light data service with Class 4 DPRS management" (code '1001'B) OR "light data service with Class 3 DPRS management" (code '1010'B) may be used; It is also allowed to use DPRS-N.34 (Service negotiation at call setup).
- It is allowed to use DPRS-ME.2, DPRS-ME.3 or DPRS-ME.4. IF DPRS-ME.2 THEN feature DPRS-N.34 is mandatory.
- Feature DPRS-N.33 (Dynamic parameters allocation) shall be supported, at least for the Application indicator and capability octets in <<Setup capability>>. IF DPRS-ME.2 then feature DPRS-N.33 shall be supported in full.
- The Generic Multiprotocol Interworking to external IP networks described in DPRS [15], clause B.8.4.1 shall be used.
- The feature DPRS-N.35 (Service change) shall be supported.

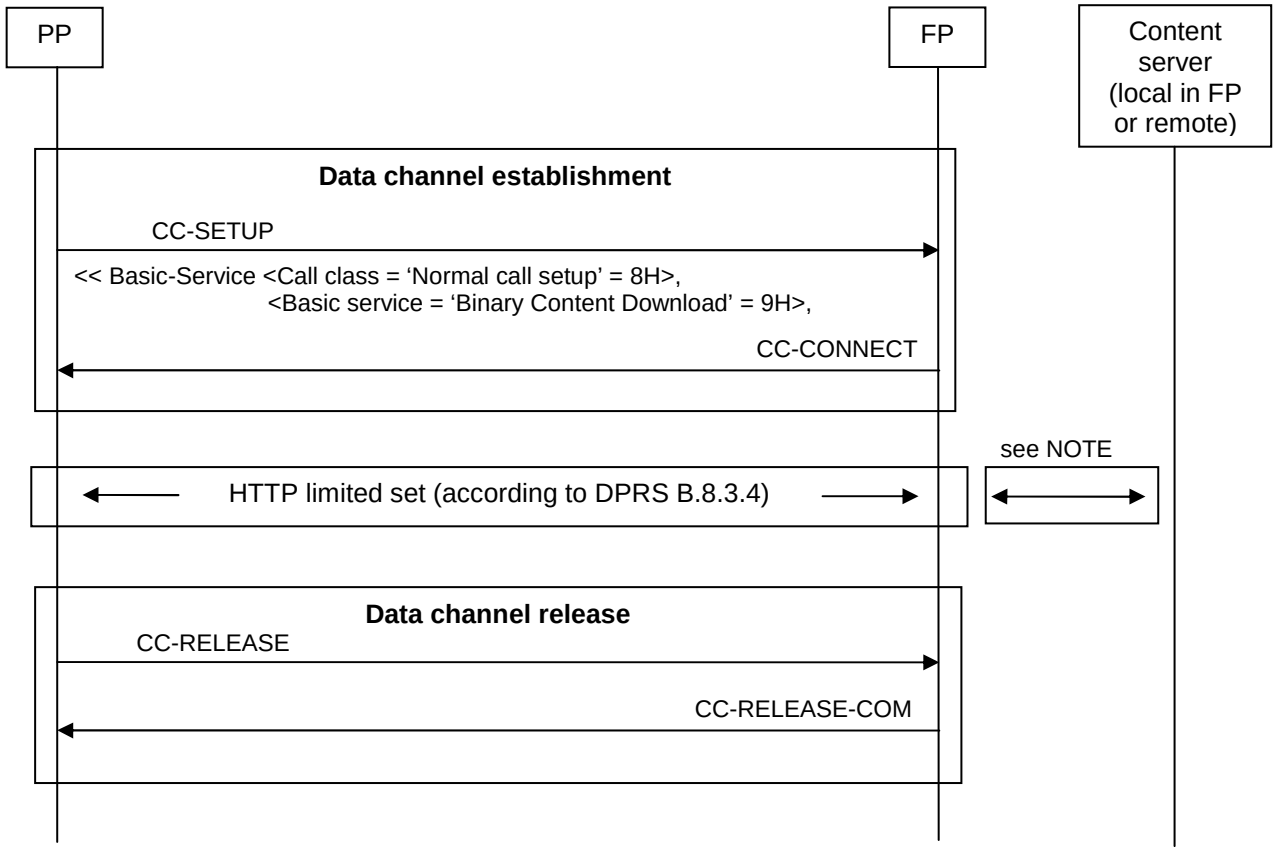
7.6.1.3 Binary content download media type

For the "Binary content download" feature, the client shall support at least media type "application/octet-stream", as specified in clause A.1.5.

NOTE: In the context of the HTTP protocol, media types are used in the "Accept" (from client) and "Content-Type" (from server) header fields. Media types allow content type negotiation and content type notification.

7.6.1.4 Binary content download sequence

The binary content download feature shall use the following sequence of messages.



NOTE: FP to content server data exchange is out of scope of the "Binary content download" feature description. This data exchange may or may not involve HTTP.

Figure 13: DECT connection for "Binary content download"

File downloading resumption. Thanks to the use of partial GETs ("Range" header mechanism), the PP can download a file in several steps, either by using several GET messages within the same connection, and/or by using several connections (e.g. following a connection break down).

7.6.1.5 URI-based PP to FP security requirements

The following two procedures allow the PP to require the FP to use one or several security features with the server when retrieving an HTTP resource over the network.

NOTE 1: These procedures use the Request URI and therefore extend clause A.1.3, "Request URI and Host header field" of the "Common HTTP profile".

NOTE 2: Both types of security requirements (respectively defined in clauses 7.6.1.5.1 and 7.6.1.5.2) may be combined in a single URI.

NOTE 3: Use of the following two procedures, together with an extension of their use with URLs sent via the C-plane, is illustrated in clause B.3 in the case of SUOTA. See also clause 7.6.2.4.

In case the FP does not implement the required security feature, the FP shall send the status code "700 Unimplemented security feature".

7.6.1.5.1 URI-based PP to FP confidentiality requirement

The "URI-based PP confidentiality requirement" procedure allows the PP to request the FP to use confidentiality when retrieving an HTTP resource over the network.

NOTE 1: A security requirement for confidentiality is not intended to protect PP to FP exchange of data, which are protected by DECT specific means.

A PP implementing the present procedure:

- shall be able to send to the FP a URI with "https" scheme value, as in:
  GET https://suota.example.com/path/file.bin **HTTP1.1;**

- shall be prepared to receive a status code "700 Unimplemented security feature" as a response to the request.

A FP implementing the present procedure:

- shall implement HTTPS;

- shall interpret the presence of the "https" scheme value as a requirement for using HTTPS with the corresponding server for ensuring the confidentiality of the exchange, and shall fulfil this requirement.

NOTE 2: HTTPS relies on a SSL/TLS layer between HTTP and TCP.

NOTE 3: Encryption only relies on the server encryption private and public keys, and corresponding certificate (the FP does not need to own any encryption key). The FP should implement a TLS/SSL stack and embed/trust the public key of the server certificate authority, or of one of its ancestors.

7.6.1.5.2 URI-based PP to FP authentication requirement

The "URI-based PP authentication requirement" procedure allows the PP to request the FP to use a client authentication scheme on behalf of the PP when retrieving an HTTP resource over the network.

A PP implementing the present procedure:

- shall be able to send to the FP a URI with *authority* part containing a *userinfo* element of the form "username:password@", as in the following example:

EXAMPLE: **GET** http://pp1:mypassword@suota.example.com/path/file.bin **HTTP1.1**.

- shall be prepared to receive a status code "700 Unimplemented security feature" as a response to the request.

A FP implementing the present procedure:

- shall implement HTTP-based "basic" **and** "digest" authentication.

- shall interpret the presence of a "userinfo" element within the "authority" part of the URI as a requirement for using HTTP-based "basic" or "digest" authentication (as requested by the server) with the corresponding server for ensuring the authentication of the PP, and shall fulfil this requirement.

NOTE: For PP authentication to work this way, the PP should entrust the FP with its own authentication password, and therefore should trust the FP.

7.6.1.6 PP to FP enhanced interactivity

The "PP to FP enhanced interactivity" procedure allows the PP to send HTTP requests with data (most notably "completed forms") to the FP (and beyond). It allows to create enhanced "Binary content download" based applications.

NOTE 1: This procedure is not used by the "Software upgrade over the air" feature, which relies on the C-plane for the same purpose.

A PP compliant with the present procedure shall implement the "Extended HTTP profile" of clause A.2.

NOTE 2: Distributed applications with a PP embedded local tier may exist that do not make use of the enhanced interactivity provided by the present procedure-only relying on URLs for PP to FP (limited) interactivity. However, URL-based interactivity (such as parameters sending) is inefficient for large amounts of data and does not provide a standard way of handling character encodings.

A PP compliant with the present procedure shall be able to send POST requests using the "multipart/form-data" format as described in clause A.2 (and especially upon request of the server, e.g. using "encType" attribute if XHTML <form> tags are supported).

A FP compliant with the present procedure shall be prepared to receive POST requests as described in clause A.2 and to forward them to the content download application remote tier.

7.6.2 Software upgrade over the air (SUOTA)

7.6.2.1 SUOTA general requirements

7.6.2.1.1 Definitions

Software package: A set of files sharing the same version identifier, and needed by the PP for installing or upgrading an application or a firmware. The software package is often simply referred to as the "software".

Software version identifier: This parameter identifies a software package, including the software package version. From PP to FP, this parameter identifies the currently installed software package. From FP to PP it identifies the software package to be installed as a result of the upgrade (and is shared by all the files needed for the upgrade). Details and examples are provided in clause 7.5.5.2.1.

Software upgrade management server (MS): The site of a PP vendor, or operated on behalf of a PP vendor, where information about new software image releases for handsets, and their locations (on the downloading server) can be found.

Software upgrade downloading server (DS): The site of a PP vendor, or operated on behalf of a PP vendor, from where the software image releases can be downloaded.

7.6.2.1.2 SUOTA general description

The "Software upgrade over the air" feature allows the software (or firmware) upgrade of a New Generation DECT, part 4 PP in front of a New Generation DECT, part 4 FP. This software may be made of one or several files sharing the same version. The SUOTA feature includes procedures for:

- information exchange in the C-Plane; and
- actual downloading of the software (or firmware) by the PP. For this download, the "Binary content download" feature is used (i.e. using an HTTP connection is used between the PP and the FP). Implementation of the "Binary content download" feature is therefore a prerequisite for the SUOTA feature.

As an addition to the "Binary content download" model, the SUOTA feature uses an extra "middle tier" on the FP which exchanges software upgrade specific commands with the PP and issues its own requests toward the management server.

The SUOTA feature defines the following two types of SUOTA. Both SUOTA types use a common PP to FP protocol.

1) **Basic SUOTA** is described end-to-end from PP to MS and from PP to DS, and uses plain http up to the servers. FP to MS protocol is the object of annex B.

2) **Enhanced SUOTA** enables the use of a non limited list of optional additional features for the FP to MS exchanges (authentication, confidentiality, device identification, etc).

NOTE 1: Enhanced SUOTA is expected to be used mostly in the case of telecom operator managed devices.

Only the PP or MS can decide to use enhanced SUOTA; otherwise, basic SUOTA shall be used by the FP. In enhanced SUOTA, although the FP to MS protocol is enhanced, URL1 received from the PP shall still be used by the FP as an entry point to the MS.

NOTE 2: This means that with enhanced SUOTA, the FP to MS protocol should still be http based.

NOTE 3: Use of enhanced SUOTA by the PP/MS can only be successful if the FP implements the needed enhanced features.

Multiple handset systems

In multiple handset systems, each handset handles SUOTA independently. In case of simultaneous attempts from several PPs, the FP could reject all but one attempt from them (using a "Retry later" negative acknowledgement for the other, see clause 7.5.5.2.4).

FP upgrade

Although the SUOTA feature only deals with the upgrade of PPs, a FP implementing the feature shall be capable of firmware upgrade of itself (with a software upgrade method outside the scope of the present document).

The SUOTA process for a PP shall not be interrupted by the upgrade of the FP.

Upgrade of the FP shall always guarantee that the FP is still compatible with the implemented features of the present document as a result of the upgrade. In particular, this means that PPs shall still be able to use SUOTA.

7.6.2.1.3 Protocol overview

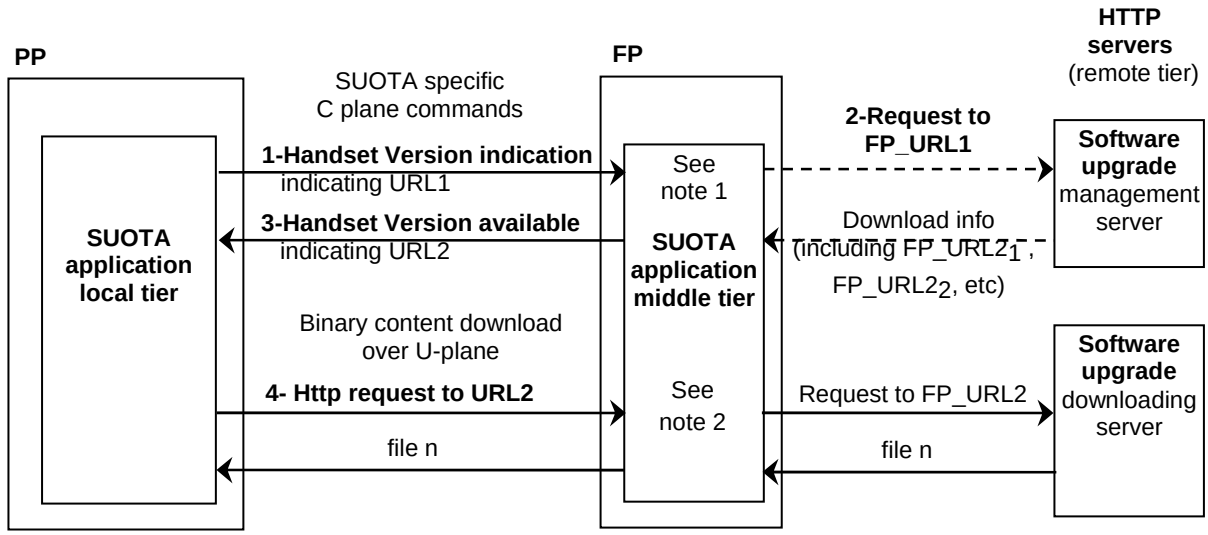


Figure 14: Software upgrade overview

The SUOTA feature comprises 4 steps summarized in figure 14 above and further detailed in clause 7.6.2.2:

- Steps 1, 3 and 4 are repeated as many times as there are files to be downloaded for a given software upgrade: the PP carries out step 1 again after step 4, until URL2 in the response (step 3) is absent.
- Step 2 is the step in which the FP retrieves the next file to be downloaded. First use of step 2 by the FP includes a request to MS (FP_URL1), in order to get all file urls needed for the upgrade (FP_URL2_n, $1 \leq n \leq N_f$). In the next uses of step 2, the FP retrieves the next file url locally.

NOTE 1: A PP may hold several URL1 values. See clause 7.6.2.2.1.

For the description of the SUOTA feature, the following definitions apply:

URL1: URL1 is defined as a PP-embedded URL entry point to the PP vendor management server.

NOTE 2: A PP could hold several URL1 values. See clause 7.6.2.2.1.

FP_URL1: request url to the MS, used to retrieve the set of file urls needed for the upgrade.

NOTE 3: If the FP to MS interface of annex B is used, FP_URL1 is equal to URL1 with appended parameters.

FP_URL2: Url variable representing the current file url to be downloaded, from FP point of view (retrieved in step 2).

URL2: Url variable representing the current file url to be downloaded, from PP point of view. URL2 is used by the PP in the "Binary content download" feature from PP to FP. URL2 may be equal or not to FP_URL2 depending on the used scenario (see clauses 7.6.2.2.3 and 7.6.2.2.3 for details).

7.6.2.1.4 SUOTA protocol steps: overview

The "Software upgrade over the air" protocol comprises the 4 steps defined in the following sub-clauses. These steps are used several times. First use of step 2 is remote, subsequent uses of step 2 are local. Figure 15 summarizes the use of these steps.

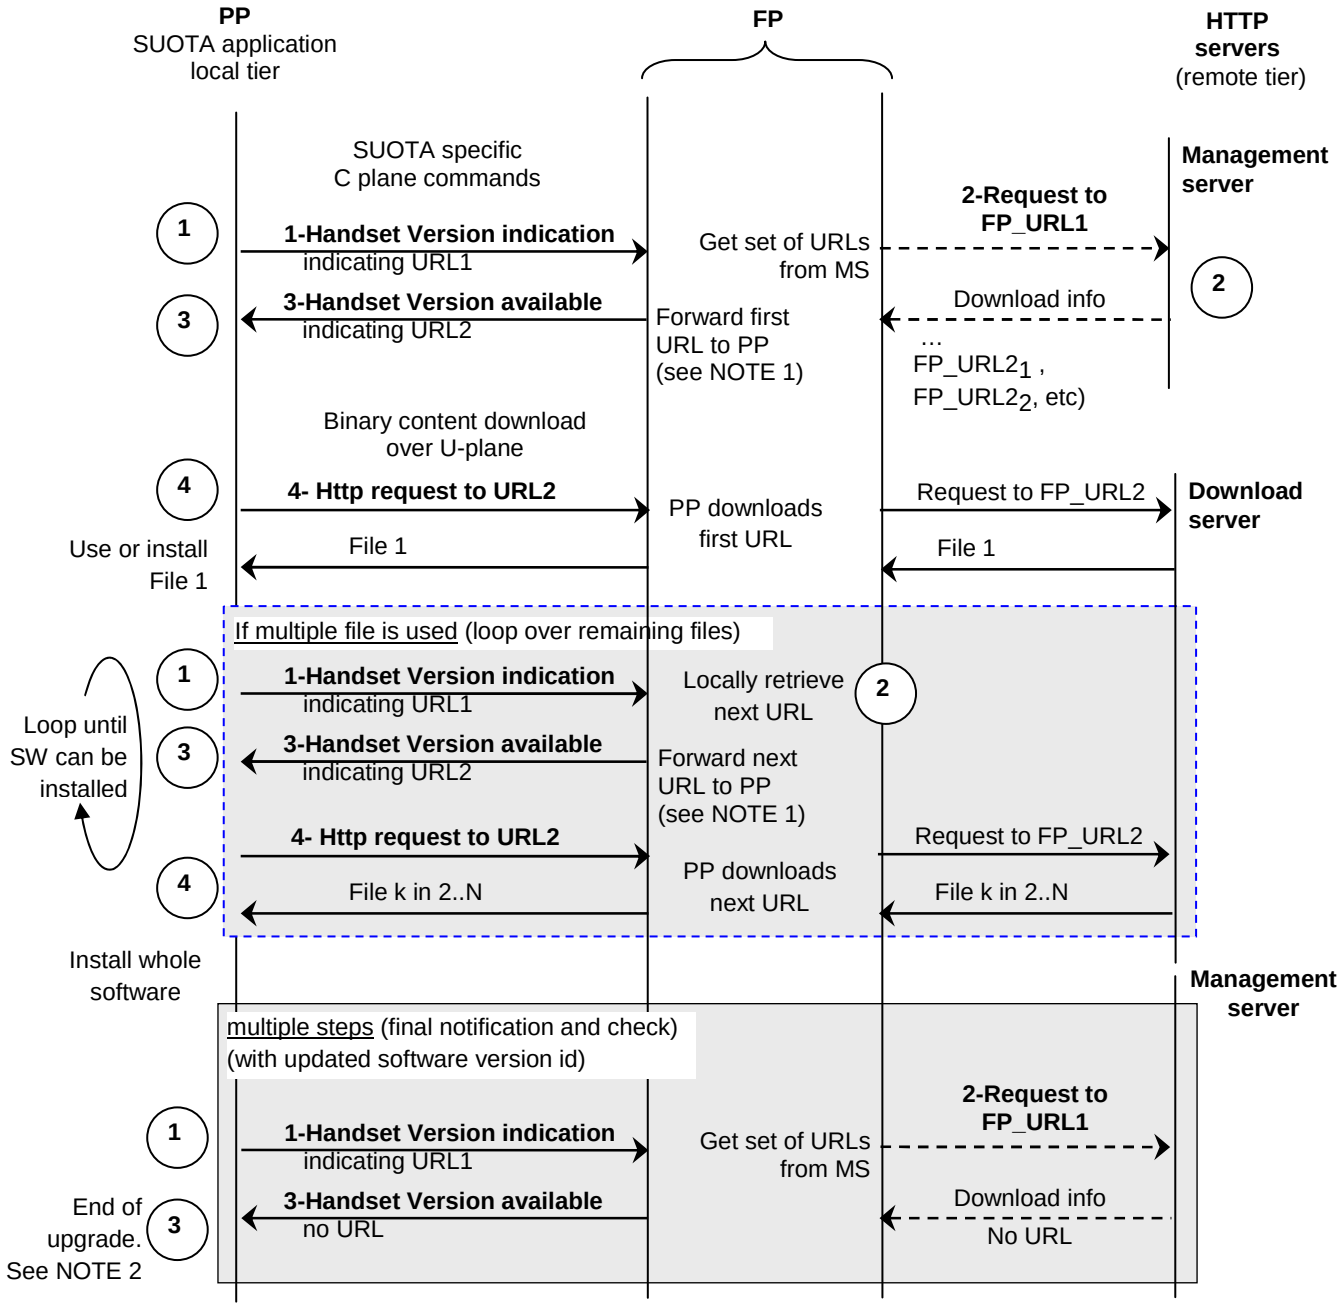

Figure 15: Software upgrade overview sequence chart

NOTE 1: FP_URL2$_1$, FP_URL2$_2$, … may be forwarded as is to the PP (URL2 = FP_URL2$_1$, etc) or a transient URL2 value pointing to the FP itself may be used instead.

NOTE 2: Retrying software upgrade allows to systematically notify the management server of successful software upgrade. In case of so-called "multiple step" software upgrade, the whole process is restarted (in that case, the MS sends a new set of URL instead of "no url"). See clause 7.6.2.5.

NOTE 3: A single PP upgrade may imply the download of several files (cf. the "fileNumber" parameter in the handset version indication command of clause 7.5.5.2.1). Hence the optional "multiple file" block for downloading files 2 to N_f ($N_f \geq 2$).

7.6.2.2 Basic SUOTA protocol steps

Use of Basic SUOTA is illustrated in clause B.3.

7.6.2.2.1 Step 1-PP sends a "Handset version indication" command to the FP

In step 1, the PP sends to the FP a "Handset Version indication" command as defined in clause 7.5.5.2.1. This command shall be sent:

- either following an "external triggering event" as defined below. In that case the "fileNumber" parameter of this command is set to "1", indicating that the first file for the software upgrade to come (if any) is requested. In that case, the <URL to follow> field shall be set to "1".

- or following step 4 (clause 7.6.2.2.4) in order to loop over the steps to retrieve subsequent files (in case more than one file is needed, i.e. in case of multiple file software upgrade). In that case, the <URL to follow> field should be set to "0".

External triggering event. Event triggering the overall software upgrade process. The following external triggering events types shall be supported:

1) "periodic attempt" (coded in the PP for regularly checking availability of a new version);

EXAMPLE: The PP could for example send a "Handset version indication" command every 5th day.

2) "successful software upgrade". See clause 7.6.2.6, "Final notification of success and multiple step SUOTA" for details.

The following external triggering event types may be supported:

3) "push" (if software upgrade is triggered by an MS originating message). See clause 7.5.6 for details.

4) "user initiated SUOTA". See clause 7.6.2.7, "User initiated SUOTA" for details.

Command parameters. The "Handset version indication" command includes, among other parameters:

- The <URL to follow> parameter, indicating presence of URL1 in a subsequent "URL indication" command. URL1 is the entry point to the management server (only present for the first use of step 1).

- The current "Software version identifier" of the software installed on the PP and to be upgraded. Goal of the "Software upgrade over the air" feature is the download of a newer version. In case installation of a new version requires uninstallation of the previous version, the previous version identifier shall still be used.

- The value of a file counter ("fileNumber"), indicating the number of the requested file. To request the first file, the fileNumber parameter shall be set to "1".

NOTE 1: A PP may hold several URL1 values, especially to provide for the case the FP would not implement a security requirement included in one of them (see clause 7.6.2.4). Additionally, a different URL1 value could be tried if a "negative acknowledgement" (see clause 7.5.5.2.4) of type "unreachable URL1 (server error)" is received from the FP in response to a "Handset Version indication" command.

Between two consecutive uses of the "Handset version indication" command, the "Software version identifier" shall not change, unless the new software image has been completely downloaded and installed in between (i.e. all files for the new version were received).

NOTE 2: In contrast to this, the "Handset version available" command sent in step 3 as a response from FP to PP should contain the **new** "Software version identifier".

Between two uses of the "Handset version indication" command with the same "Software version identifier", the PP shall increment the value of the "fileNumber" parameter by 1, in order to get the next file url in the subsequent "Handset version available" command. Incrementation of the parameter shall also be interpreted by the FP as a notification of correct download and handling of the previous file by the PP.

Error handling: The PP shall not use the same "fileNumber" value twice for the same "Software version identifier", unless:

- it has not received the corresponding response;
- it uses it to notify a failure as specified in clause 7.6.2.6, "Notification of failure", with a non-zero reason field. This includes possible requests for a new delay if the PP built-in download window cannot be respected. Use of a non-zero value shall imply contacting the MS in step 2.

7.6.2.2.2 Step 2-FP retrieves url of the next file to be downloaded (FP_URL2)

In step 2, the FP retrieves the url of the next file to be downloaded (called $\mathbf{FP\_URL2_n}$) either locally or remotely from the management server.

The first time step 2 is used (n = 1), the FP shall contact the MS in order to retrieve the set of all FP_URL2 values (if a new software version is available). The FP determines the request to be used toward the MS for this purpose (called **FP_URL1**). More specifically:

- the FP shall construct FP_URL1 using URL1 received from the PP as a base URL.
- FP_URL1 shall be constructed by appending device specific information to URL1, as defined in clause B.1, "Basic SUOTA FP to management server interface".
- the FP shall send an HTTP GET request to FP_URL1 on the MS.

NOTE: The FP should be prepared to receive an HTTP redirection status code (3xx) as a result of using URL1.

Based on the received parameters, the MS returns the download information for the next software version, including the set of all needed **FP_URL2** values (N_f values, with $1 \leq N_f \leq 15$, or 0 values if no new software version is available). The download information is received as text information with "Content-Type" value of "application/xml", as described in clause C.2, "Basic SUOTA management server to FP interface".

In the next uses of step 2 ($n \geq 1$), $\mathbf{FP\_URL2_n}$ is retrieved locally in the FP.

7.6.2.2.3 Step 3-The PP receives the "Handset version available" command from the FP

In step 3, the FP sends a "Handset version available" command defined in clause 7.5.5.2.2, to the PP. This command shall always be sent upon reception by the FP of a "Handset version indication" command.

Upon reception of a "Handset version indication" command with a given "Software version identifier", and with a "fileNumber" field equal to "n" (i.e. for the "n^{th} use" of step 3), the FP shall follow one of the following options:

- **Option 1:** If there is no new software image available, the FP shall reply with a "Handset version available" command with a <URL to follow> field set to "0" ("No url" response). This should only be used once, when n = "1".
  - This reply shall end the Software upgrade process on PP side (and until a future triggering event occurs).
- **Option 2:** Or, if a new software image is available, and $1 \leq n \leq N_f$, the FP shall reply with a "Handset version available" command, which:
  - shall contain the "Software version identifier" of the new software image (i.e. necessarily different from the value sent in the "Handset version indication" command);
  - shall contain a <URL to follow> field set to "1" and shall be followed with a "URL indication" command containing $URL2_n$, to be used by the PP in step 4 for downloading the n^{th} file (see "$URL2_n$ value determination" below).

- **Option 3:** Or, if a new software image is available, and $n > N_f$, the FP shall reply with a "Negative acknowledgement" command, with reason field "File does not exist". This should never happen and is an error case, as the PP having received the needed N_f files should have installed the new software version already. In that case the PP shall revert to a stable version if possible.

- **Option 4:** Or, if the reason field in the "Handset version indication" was non-zero indicating a PP failure and implying contacting the MS in step 2, the FP shall answer to the PP according to the provisions of clause 7.6.2.6, "Notification of failure".

"No url" (option 1): Two main situations lead to option 1 above:

- an external event triggered the sending of this command (reboot, periodic attempt, etc), but the PP had an up-to-date version installed;

- the PP just completed the installation of a new software version (having received all files pertaining to that version) and sends this command in order to allow for a possible multiple-step software upgrade (see step 1, clause 7.6.2.2.1)-but there is no additional step foreseen on MS side. This can be considered a subcase of the previous situation.

$URL2_n$ value determination (option 2): In option 2 above, $URL2_n$ shall be equal to FP_URL2_n. In other words, the FP forwards FP_URL2_n received from the MS "as is" to the PP.

NOTE: This is not necessarily the case when Enhanced SUOTA is used, see clause 7.6.2.3.3.

DelayMinutes value: The provisions of clause 7.5.5.2.2 shall be respected.

7.6.2.2.4 Step 4-PP and FP gets the current file from the downloading server

Step 4 is used in the case option 2 is used in step 3. The PP initiates an HTTP connection to $URL2_n$, using the "Binary content download" feature.

The entry point used on the network side by the FP shall always be $FP\_URL2_n = URL2_n$. The FP is almost transparent and also uses HTTP toward the network. More specifically, the FP:

- may use HTTP GET partial request toward the network (as the PP does toward the FP when using the "Binary content download" feature);

- may adjust the "Range" and "Content-Range" headers to its own memory and data rate constraints.

After downloading the file, the PP shall use the downloaded file as appropriate (e.g. install it, and possibly install the whole new software version if this is the last file), and go back to step 1 again (until the process ends in step 3, option 1, when the FP sends a "Handset version available" command with no URL2 value)

Media type: The PP shall use "Accept: application/octet-stream" header in the request. The only media type used by the server in the "Content-Type" header shall be "application/octet-stream".

NOTE: In the context of the HTTP protocol, media types are used in the "Accept" (from client) and "Content-Type" (from server) header fields. Media types allow content type negotiation and content type notification.

Error handling: In case of failure of a GET request during the software image download in step 4:

- If an HTTP error is received from the server, the FP shall forward it as is to the PP.

- If the download was interrupted for any reason, the PP may use additional partial GET requests to retrieve the whole file (see clause 7.6.1.4, "File downloading resumption" and clause A.1.7.3).

- If the download cannot occur and be completed immediately after the "DelayMinutes" value timed out, the PP shall follow the provisions of clause 7.5.5.2.2 about the "DelayMinutes" parameter.

7.6.2.3 Enhanced SUOTA protocol steps

Enhanced SUOTA is introduced in clause 7.6.2.1.2, "SUOTA general description" and defined in the present clause. Enhanced SUOTA re-uses 7.6.2.2, "Basic SUOTA protocol steps" as a prerequisite, but allows some variations. Although the set of protocol enhancements usable with Enhanced SUOTA is not limited, the principles described in the present 7.6.2.3 clause shall be respected.

In particular, use of Enhanced SUOTA for the PP upgrade shall always be decided by the PP in step 1, or equivalently by the MS in step 2, but never by the FP itself (although it may be **initiated** by the FP in step 1 in some cases, see clause 7.6.2.3.1).

NOTE 1: Use of enhanced SUOTA by the PP/MS can only be successful if the FP implements the needed enhanced features.

NOTE 2: Use of Enhanced SUOTA is illustrated with 4 examples in annex C.

7.6.2.3.1 Step 1- Enhanced SUOTA possible variants

The provisions of clause 7.6.2.2.1 (Step 1) apply with the following modifications.

When using Enhanced SUOTA, URL1 received from the PP in step 1 shall be used in any case as an entry point to the MS in step 2.

Enhanced SUOTA initiation in step 1. Enhanced SUOTA may be initiated in step 1 using one of the following methods:

- Use of an enhanced feature may be initiated by the PP using security requirements for URL1 in step 1 (see clause 7.6.2.4, "PP security requirements in URL1 and URL2" and clause C.1 for an example).
- Use of an enhanced feature may be **initiated** by the FP in step 1, using URL1 as a known identifier triggering the use of some enhanced features (hence Enhanced SUOTA), although URL1 as such does not necessarily reflect this (i.e. does not contain any security requirement). This method can only be used if the FP knows the PP and MS, and therefore knows that the PP and MS require these features to be used.

NOTE: For instance, the FP could use HTTP POST method to send data to URL1, instead of the HTTP GET method, or initiate an HTTPS session to URL1, etc. See clauses C.3 and C.4 for examples.

7.6.2.3.2 Step 2-Enhanced SUOTA possible variants

The provisions of clause 7.6.2.2.2 (Step 2) apply with the following modifications.

Enhanced SUOTA initiation in step 2: Enhanced SUOTA may be initiated in step 2 using the following method:

- Use of an enhanced feature may be initiated by the MS in step 2 upon reception of a request to URL1 or to a URL1-based request, if this is a dynamically discoverable feature (e.g. RFC 2817 [24] describes a way for a server to initiate a TLS session upon receiving a plain HTTP request, see clause C.2).

As stated above, with Enhanced SUOTA, URL1 received from the PP in step 1 shall be used in any case as an entry point to the MS by the FP in step 2. However, if Enhanced SUOTA is used, and in contrast to when Basic SUOTA is used:

- The protocol used to retrieve the download information need not be HTTP.
- The FP to MS interface need **not** be the one described in annex B (whereas Basic SUOTA uses annex B). The way needed input parameters are provided to the MS is out of scope of the present document.
- The download information could be retrieved by the FP from the MS in one or several steps, whereas Basic SUOTA retrieves all information in one step (in the first use of step 2).
- Whether download information is retrieved locally or remotely in the n^{th} use of step 2 is out of scope of the present document (whereas the FP using Basic SUOTA retrieves all information remotely in the 1^{st} use of step 2, and locally afterwards).

NOTE: In any case, the file url for the n^{th} file (FP_URL2_n) should be retrieved by the FP for the n^{th} use of step 2 at the latest.

7.6.2.3.3 Step 3-Enhanced SUOTA possible variants

The provisions of clause 7.6.2.2.3 (Step 3) apply with the following modifications.

$URL2_n$ value determination (option 2). If Step 3 option 2 is used (see clause 7.6.2.2.3), and in contrast to Basic SUOTA, $URL2_n$ sent to the PP may be different from FP_URL2_n received from the MS.

In any case, the FP shall still keep FP_URL2_n and use it in step 4.

More specifically, $URL2_n$ may be chosen by the FP as a transient "self-pointing URL".

NOTE: A self-pointing URL points to the FP itself (acting as a local server) and uses "localhost" as its host name (see clause A.1.3.1).

7.6.2.3.4 Step 4-Enhanced SUOTA possible variants

The provisions of clause 7.6.2.2.4 (Step 4) apply with the following modifications.

When using Enhanced SUOTA:

- The "Binary content download" feature is still used between the PP and the FP for transferring the next file to the PP. The PP initiates an HTTP connection to $URL2_n$, using the "Binary content download" feature.
- However, $URL2_n$ sent by the FP to the PP could point to an entry point located on the FP itself, the FP acting as a local server (the FP hides FP_URL2_n from the PP).
- The FP still uses FP_URL2_n received from the MS in step 2 to retrieve the file from the DS.

NOTE 1: FP_URL2_n in scenario 2 when Enhanced SUOTA is used could in fact be any address from any protocol-dependent addressing scheme (it could even not be an URL).

NOTE 2: The PP may be aware of the use of Enhanced SUOTA, if URL2 received from the FP is local.

Error handling: In case of failure of a GET request during the software image download in step 4, and as an addition to the error cases already handled in clause 7.6.2.2.4:

- If an error is received from the server (potentially non-HTTP based), the FP shall use the most appropriate HTTP error toward the PP.

7.6.2.4 PP security requirements in URL1 and URL2

The present procedure describes an enhancement of clause 7.6.2.2, "SUOTA protocol steps", allowing the PP to require security functions to be used by the FP when retrieving software upgrade information, and when actually downloading the software image.

NOTE 1: Step 2 and step 4 of clause 7.6.2.2 already allow the FP to use alternative mechanisms (possibly involving security) even if the PP does not require anything.

NOTE 2: The present procedure is illustrated in clause C.1 (Enhanced SUOTA example initiated by the PP).

A PP or FP **implementing** the present procedure shall implement at least one of the procedures described in "URI-based PP to FP security requirements" of clause 7.6.1.5. Furthermore, the provisions of clause 7.6.1.5 shall also apply to URL1 sent via the C-plane.

A PP **using** the present procedure shall, as an enhancement to step 1 (clause 7.6.2.2.1), add one or more security requirement(s) to URL1 sent in the "URL indication" commands following the "Handset version indication" command.

The PP shall check whether the FP supports all of these requirements before using them. If the FP does not implement all of the security functions required in a given URL1 value, the PP shall not use this value and shall use another URL1 value it holds. A PP shall always hold at least one URL1 value with no attached security requirement.

A FP implementing the present procedure shall, when receiving URL1 with security requirements, perform the following actions if applicable:

- as an enhancement to step 2 (clause 7.6.2.2.2), make use of all of these security functions when collecting software upgrade information from the management server. This only applies if the FP does not ignore URL1 as specified in step 2 (clause 7.6.2.2.2);

- as an enhancement to step 3 (clause 7.6.2.2.3), transmit FP_URL2 = URL2 with included security requirements. This only applies if the FP choose scenario 1 (clause 7.6.2.2.4.1).

NOTE 3: The management server, inferring that the FP implements theses functions may send FP_URL2 with the same security functions.

7.6.2.5 Final notification of success and multiple step SUOTA

As specified in clause 7.6.2.2.1, "Step 1-PP sends a "Handset version indication command to the FP", a successful software upgrade shall be considered as an external event triggering a "SUOTA attempt" on PP side.

The corresponding "Handset version indication" command shall contain the new "Software version identifier" (of the just installed software version), and a "fileNumber" parameter reset to "1". This allows:

- the PP to systematically notify the MS of a successful software upgrade;

- the MS to possibly initiate a new step of a "multiple step" software upgrade.

NOTE: A multiple step software upgrade could be needed if a direct upgrade to the target software version is not possible or has not been tested.

7.6.2.6 Notification of failure

In case the PP is unable to download or install file "n", it shall send a "Handset version indication" command for the purpose of notifying the failure to the FP and MS.

- The "reason" field of the "Handset version indication" command shall be set to a non-zero value, as specified in clause 7.5.5.2.1, "*Handset version indication* command".

- The "fileNumber" field (= "n") shall be interpreted as the number of the file, for which "download" or "application" (i.e. intended use, for example: installation, reading of contained parameters, etc.) failed.

- The "Software version identifier" field shall still refer to the currently installed version of the software, not to the version for which a failure occurred (which is not installed). The MS can identify the failing version from the download information it sends in response to this value.

When using **Basic SUOTA**, the FP shall in turn notify the MS a specified in clause B.1, setting the reason parameter in FP_URL1 to the selected non-zero value (default value when absent is "0").

When using **Enhanced SUOTA**, the way the FP notifies the MS, if it does, is out of scope of the present document.

Whatever kind of SUOTA is used, in response to a failure notification, the MS:

- may re-send download information (with a possibly updated "DelayMinutes" value);

- should re-send download information with updated "DelayMinutes" value if the "reason" field value was "Unable to download in time-New DelayMinutes requested";

- may indicate "No url" (see **"No url" (option 1)** in clause 7.6.2.2.3, for details), thus taking into account the failure.

In case the MS re-sends download information, the FP shall answer the PP as usual in a "Handset version indication" command:

- with the url for the n^{th} file, where "n" was the "fileNumber" field value in the "Handset version indication" command notifying failure; and

- with the new "DelayMinutes" value received from the MS.

7.6.2.7 User initiated SUOTA

When a real user originates a SUOTA attempt (e.g. triggering SUOTA through a dedicated menu), and only in that case, the "Handset version indication" command shall bear the following modification:

- the "User initiated software upgrade" flag of the "Flags" field shall be set to "1".

NOTE 1: Access to this service need not be granted to the end user (e.g. could be reserved for the after-sales service).

When using **Basic SUOTA**, the FP shall in turn notify the MS as specified in clause B.1, setting the "UIS" parameter to "1" in FP_URL1 (default value when absent is "0").

When using **Enhanced SUOTA**, the way the FP notifies the MS, if it does, is out of scope of the present document.

NOTE 2: Notifying the MS enables a better user experience: the MS could in return grant a "0" value for the "DelayMinutes" parameter in the "Handset version available" response.

7.6.3 HTTP-based applications

7.6.3.1 HTTP-based applications general requirements

The "HTTP-based applications" feature allows easy implementation of user interface based applications, thanks to a rendering engine located in the PP. The application code and data are remotely hosted, either in the FP, or in an HTTP server, or both.

NOTE 1: The "HTTP-based applications" feature does not allow local interactions between the application and the PP local APIs.

There are two different XHTML profiles; the Baseline XHMTL profile (see clause 7.6.3.6) and the Simple XHTML profile (see clause 7.6.3.5).

The user interface is XHTML based. DECT handset shall implement the "Simple XHTML profile" of clause 7.6.3.5 and may implement the "Baseline XHTML profile" of clause 7.6.3.6. Remote applications designed for use on DECT handsets implementing one of these profiles shall be DECT specific and only use the subset of XHTML defined there. The Baseline profile is defined for ensuring interoperability but remains optional for the PP.

Implementation of the "Extended HTTP profile" of clause A.2 (including the "Common HTTP Profile" of clause A.1) is a pre-requisite for a PP implementing the "Baseline XHTML profile".

NOTE 2: A FP may also implement server-side "HTTP-based applications" compliant applications. In that case requirements applying to a DECT specific server apply to the FP.

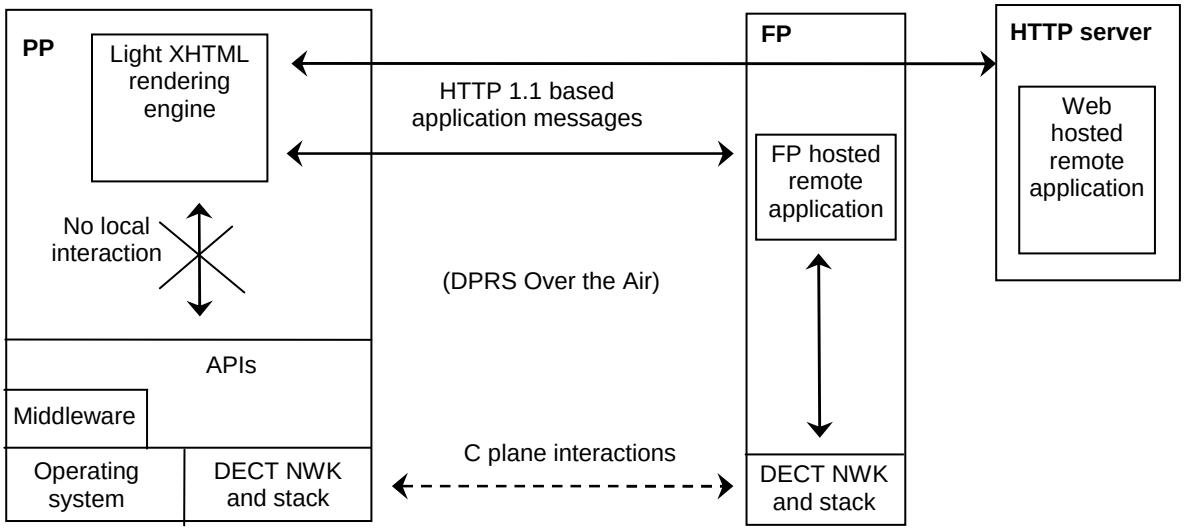

Figure 16: Remote application using the "HTTP-based application" feature

NOTE 3: An "HTTP based application" based application remote tier (unlike that of a "Binary content download" based application) works on any PP implementing the used XHTML subset (i.e. does not need to be hosted by the PP vendor).

NOTE 4: The remote tier of an "HTTP based application" based application (unlike that of a "Binary content download" based application) may be located on the FP.

7.6.3.2 Support of additional HTTP header fields

In addition to the uses of HTTP header fields defined in clause A.1.4, the PP shall support the following header fields, or new uses of these fields.

Table 26: Additional HTTP header fields

Name	Direction	PP status	FP status	Normative action/comment
Accept	PP to FP	M	M	Additional use for describing the type of audio, image files supported. See clause 7.6.3.3.
Accept-charset	PP to FP	M	M	To indicate support of UTF-8, iso-8859-1 and possibly additional charsets (see note 1)
User-Agent	PP to FP	M	C3601	Possible values for version Part4 version 1.1.1: - NG-DECT-Part4/1.1.1 (A.1; A.2; NGLDS-A.3) - NG-DECT-Part4/1.1.1 (A.1; A.2; NGLDS-A.3; 7.6.3.6) See also clause A.1.4
C3601: IF the FP plays the server role THEN M ELSE N/A				

NOTE: HTTP uses the phrase "character set" (abbreviated as "charset"), whereas "character encoding" would be more appropriate.

7.6.3.3 Support of additional media-types

When the PP requests a media file of a given media type (e.g. "image", "audio", etc) with the GET method, the PP should use the "Accept" header in order to indicate to the server its preferred subtype(s) for the given media type. The server then indicates the actual subtype used in the "Content-Type" header of the response.

NOTE 1: In the context of a binary content download (see clause 7.6.1), an image or audio file may be sent with the "application/octet-stream" media type.

NOTE 2: Absence of the "Accept" header means that the PP accepts *all* media subtypes for the given media subtype.

7.6.3.4 Support of character encodings

For text based resources that need to be displayed on the screen (text or html file), the media type itself is not enough to fully determine the interpretation of the received media.

The PP shall at least support UTF-8 [i.7] character encoding formats.

NOTE 1: Support of UTF-8 only means support of the UTF-8 encoding structure at a minimum. For more information see annex E.

The PP may support ISO/IEC 8859-1 [i.11], which is equivalent to support Unicode [i.6] code points from U+0000 to U+00FF.

NOTE 2: However, for code points between U+0080 and U+00FF, UTF-8 encoding differs from ISO/IEC 8859-1 [i.11] encoding.

When requesting a text based resource, the PP should notify the server of the accepted character encodings, using the "Accept-Charset" header. The PP may support other encoding formats (ISO/IEC 8859-2 [i.12], ISO/IEC 8859-15 [i.13], UTF-16, etc), that may be easier to use or more concise for some languages. In that case, it should also use the "Accept-Charset" header to indicate it.

The server should indicate-when sending a document to the PP-the used character encoding, using the "charset" parameter of the "Content-Type" header field. The PP shall use this information in order to correctly display the content to the user. In case the charset parameter is absent, the PP shall assume that the document is UTF-8 encoded.

7.6.3.5 Simple XHTML profile

The PP shall at least support the following XHTML1.1 [27] modules. Text nodes shall use UTF-8 [i.7] encoding.

NOTE: The "Simple XHTML profile" only requires partial implementation of some modules, as indicated in the "Comment" column.

Table 27: Supported XHTML modules in Simple XHTML profile

Module	Element	Comment
Structure	body, head, html, title	Complete
Text	br, p	Partial
Hypertext	a	Partial (href attribute only)
Style	text-align: left/center/right	Used in <p>
Presentation	b	Partial

The PP shall understand all listed tags. However, the present document does not enforce the way the information is presented to the user. The PP should follow the tag definition whenever possible, and as much as possible, but may use alternative ways to render the tag in case of display or other constraints. For example, the PP shall understand (but not necessarily follow) the "<b>" tag for bold face presentation: if the PP does not hold the corresponding bold face font, it could render it with quotes, or not render it at all.

7.6.3.6 Baseline XHTML profile

The PP shall at least support the following XHTML1.1 [27] modules:

NOTE: The "Baseline XHTML profile" only requires partial implementation of some modules, as indicated in the "Comment" column.

7.6.3.6.1 Basic elements support

Table 28: Supported XHTML modules in Baseline XHTML profile

Module	Element	Comment
Structure	body, head, html, title	Complete
Text	br, h1, h2, h3, h4, h5, h6, p	Partial
Hypertext	a	Complete
List	ol, ul, li	Partial. The "value" attribute on "li" element restarts numbering
Presentation	b, i	Partial
Base	base	Complete

7.6.3.6.2 Image element support

The "img" tag shall be recognized even if the PP is not able to display images. In that case it may use the "alt" (alternate) attribute of this tag in order to display a text replacement for the image.

Table 29: Supported XHTML modules, image elements

Module	Element	Comment
Image	img	Complete

7.6.3.6.3 Tables support

Table 30: Supported XHTML modules, basic tables

Module	Element	Comment
Basic Tables	table, td, tr	Partial

7.6.3.6.4 Forms support

Table 31: Supported XHTML modules, forms

Module	Element	Comment
Forms	form, input, select, option, textarea	Partial

Consistently with clause A.2 ("Extended HTTP profile"), a <form> element shall have an enctype field with value "multipart/form-data"

7.7 Interworking requirements

NOTE: See also clause 7.6.1.2 on LU10 interworking conventions and HTTP profile.

7.7.1 IWU-attributes information element

The procedures as specified in EN 301 649, [15], clauses B.1 to B.4 and B.6 shall apply with the following differences:

- Only Frame relay (FREL) service and Interworking type Generic media encapsulation (clause B.8, [15]) shall be used.
- The coding of the IWU-ATTRIBUTES information element (clause B.2, [15]) shall be as follows:

Table 32: IWU-ATTRIBUTES information element support status

Supported parameters					
Field no.	**Name of fields**	**Ref.**	**Support**	**Values**	
				Allowed	**Supported**
1	ID of IWU attributes of variable length		M	18	
2	Length of Contents (L)		M	0 to 255	any
3	Coding standard		M	1	1
3	Profile		M	0	0
4	Negotiation indicator		M	0,2,4,6	0,2
4	Profile subtype	B.2.1	M	0 to 15	8
5, 5a	Maximum SDU size (PT => FT or both ways)	B.2.1	M	0 to 16 383 (equivalent to 0 to 131 064 octets)	191 to 16 383 (equivalent to 1 528 to 131 064 octets)
5b, 5c	Maximum SDU size (FT => PT, optional)	B.2.1	O	0 to 16 383 (equivalent to 0 to 131 064 octets)	1 528 to 16 383 (equivalent to 12 224 to 131 064 octets)
6	Application protocol control set	B.2.1.1.3	M	All values for Generic Encapsulation Interworking	All values for Generic Encapsulation Interworking
NOTE: See EN 301 649 [15], clauses B.2 and B.8.					

7.7.2 SDU sizes and setting of SDU boundaries

The chopping facility defined in DPRS Generic Encapsulation Interworking (see DPRS [15], clause B.8.2) may be optionally implemented to split large application packets into smaller SDUs. This chopping facility, when supported shall be announced by means of the IE <SETUP CAPABILITY> (see DPRS [15], clause 12.22), and shall be specifically invoked at context creation using the flag described in DPRS [15], clause B.2.1.1.4.1. This facility shall only be invoked when supported by both sides.

When the chopping facility is used, the size of the application packet segments (including the D-GMEP header), shall be set as the maximum supported SDU size announced at <<IWU ATTRIBUTES>>, except the last (or the only one) segment that may be of smaller size.

In order to use the chopping facility, the features DPRS-N.33 (Dynamic Parameters Allocation) and DPRS-N.35 (Service Change) shall be supported.

Unless the chopping facility is in use, the SDUs shall be equal to an application packet plus the D-GMEP header (see DPRS [15], clause B.8.2)

7.8 Physical layer procedures

No differences/additions - the procedures as specified in EN 301 649 [15], clause 5 shall apply.

Annex A (normative): HTTP Profiles

A.1 Common HTTP profile (HTTP limited set nr.2)

NOTE: The "Common HTTP profile" is the HTTP limited set nr. 2 listed in DPRS (EN 301 649 [15], clause B.8.3.4). The name "Common HTTP profile" is used locally in the present document.

A.1.1 General requirements

The "Common HTTP profile" defined in clause A.1 represents the minimum HTTP profile that a New Generation DECT, part 4 PPs implementing HTTP based features must implement. This profile is based on HTTP version 1.1 [22].

NOTE: The "Common HTTP profile" is a pre-requisite for:

- The **"Binary content download"** feature (clause 7.6.1).
- The **"Software upgrade over the air (SUOTA)"** feature (clause 7.6.2).
- The **"HTTP-based applications"** feature (clause 7.6.3).
- The **"Extended HTTP profile"** (clause A.2).

Use of the present annex relies on the interworking conventions defined in EN 301 649 [15] (DPRS), clause B.8.3.1.

A.1.2 Supported HTTP methods

A.1.2.1 GET method

The PP and FP shall only use HTTP unconditional partial GET requests.

NOTE: HTTP 1.1 [22] describes conditional and unconditional GET requests. Partial GET requests may be conditional or unconditional.

A GET request in the context of the present "Common HTTP profile", being always "partial", shall systematically include a "Range" header field. See clause A.1.7 for the use of a "Range" header field.

As requested by version 1.1 of HTTP, such a GET request shall always contain a "Host" header field.

A.1.2.2 HEAD method

The PP and FP should support the HTTP HEAD method, which may be useful for debugging purposes.

A.1.2.3 POST method

When both sides only support the present "Common HTTP profile", the POST method shall not be used by the PP.

NOTE: DPRS [15], HTTP limited set nr. 1 (clause B.8.3.3) and HTTP limited set nr. 3 (clause B.8.3.5) both require support of the POST method. This is however not supported within HTTP limited set nr. 2 (Common HTTP profile) described in clause A.1.

A.1.2.4 Pipelining of requests

The PP shall not use pipelining of idempotent requests (i.e. GET, HEAD, etc, but not POST) as described in HTTP 1.1 [22], section 8.1.2.2. As a result, non transparent FPs need not support the handling of pipelined requests.

NOTE: This restriction does not apply to requests from distinct flows or applications, i.e. handled with separate contexts as described in DPRS clause B.8 (unless the PP or FP only supports a single context). Such flows would use separate TCP connections on the network side anyway.

A.1.3 Request URI and Host header field

Request URI: The request URI is the URI reference included in the request line of an HTTP request.

NOTE 1: RFC 3986 [23] (section 4.2) defines a URI reference as either a URI or a URI relative reference. This RFC obsoletes RFC2396 however referred to by HTTP1.1.

A "Common HTTP profile" compliant request URI sent over the DECT air interface shall be either:

- an absolute path URI relative reference, as in **`GET`** `/path/file.bin` **`HTTP1.1`**.
- a URI with "http" scheme value, as in the next example:

EXAMPLE 1: **GET** http://suota.example.com/path/file.bin **HTTP1.1**.

NOTE 2: An absolute path URI relative reference cannot be empty, and should at least contain the starting slash character ("/").

A "Common HTTP profile" compliant HTTP request shall contain a "Host" header field, as required by HTTP1.1. When an http URI is used as Request URI, the host part of that URI and the "Host" header field value shall be identical.

Examples of an HTTP Requests (extract):

EXAMPLE 2:

```
GET /path/file.bin HTTP1.1
Host: content-download.example.com
```

EXAMPLE 3:

```
GET http://content-download.example.com/path/file.bin HTTP1.1
Host: content-download.example.com
```

NOTE 3: An HTTP request sent to a proxy should contain a full http URI. If the FP is behind a proxy, the FP may have to modify the request URI before forwarding the request to the proxy. A full http URI can be constructed from an absolute path URI relative reference using the mandatory "Host" header field value.

A.1.3.1 Use of the 'localhost' Host value

When the "Host" header field value "localhost" is sent over the DECT air interface, it shall refer to the FP.

Example of Request URIs targeting the FP:

```
GET /FPservice1/config.txt HTTP1.1
Host: localhost
```

A.1.4 Supported HTTP header fields

The following HTTP header fields shall be supported by the FP and/or PP according to the following table.

Table A.1: Supported HTTP hearer fields

Name	Direction	PP status	FP status	Normative action/comment
Host	PP to FP	M	M	Presence M in all (partial) GET requests
Accept	PP to FP	O	CA101	Absence means support of all media subtypes
Content-Type	FP to PP	M	CA101	
Content-Length	FP to PP	M	CA101	
Location	FP to PP	M	CA101	See A.1.6.
User-Agent	PP to FP	M	CA101	This header shall include the following substring: "NG-DECT-Part-4/<part 4 version> (comment)" The comment shall include a semi-colon separated list of optional clauses or features that are implemented.
Byte-range operations related headers (see also clause A.1.7)				
Range	PP to FP	M	CA101	Presence M in all (partial) GET requests
Content-Range	PP to FP	M	CA101	Presence M in successful GET responses (206 Partial Content)
CA101: IF the FP plays the server role (see clause A.1.3.1) THEN M ELSE N/A.				

The PP shall ignore a header that it does not understand. It shall not reject the response as a result.

NOTE: Clause 7.6.3.2 defines an amended value for PPs implementing the "HTTP-based applications" feature.

EXAMPLE: **Examples of product token and related comment**: a PP implementing New Generation DECT, part 4 version 1.1.1 must include one of the following strings in the User-Agent header:
- NG-DECT-Part4/1.1.1 (A.1)
- NG-DECT-Part4/1.1.1 (A.1; A.2)
- NG-DECT-Part4/1.1.1 (A.1; A.2; NGLDS-A.3)
- NG-DECT-Part4/1.1.1 (A.1; A.2; NGLDS-A.3; 7.6.3.6).

A.1.5 Supported media types

At least media type = "application/octet-stream" shall be supported (i.e. requested/accepted) as content type by both PP and FP.

NOTE: In the context of the HTTP protocol, media types are used in the "Accept" (from client) and "Content-Type" (from server) header fields. Media types allow content type negotiation and content type notification.

A.1.6 Redirections of GET (or HEAD) requests

In the context of clause A.1, a redirection received from the server in an HTTP response indicates that the client must issue a new HTTP request in order to get the requested resource. A redirection is characterized by an HTTP status code of the 3xx class in the HTTP response. The url for the new request is indicated in the "Location" header of the response.

NOTE 1: In general, the exact behaviour of the PP upon redirection depends on the status code received. See HTTP 1.1 [22], section 10.3 for details.

NOTE 2: Redirections of POST requests are possible. However, clause A.1 restricts itself to GET (and HEAD) requests. Redirections of GET (or HEAD) requests may be handled by the PP without user interaction.

NOTE 3: For the redirections of POST requests, see clause A.2.

The PP shall be able to handle redirections of GET requests with the following status codes:

- 301, "Moved Permanently". If subsequent requests to the same initial url are planned, the PP may use the redirection target url ("Location" header value) instead of the initial url.
- 302, "Found". If subsequent requests to the same initial url are planned, the PP shall however still use the initial url (e.g. for the case the redirection target would change in between).
- 307, "Temporary Redirect". In the context of a GET (or HEAD) request, the PP behaviour shall be identical as when 302 is used.

NOTE 4: The behaviour of the PP upon 301, 302, or 307 redirections is similar, except in case subsequent requests to the same initial url are planned.

The PP shall therefore also support the "Location" header of the corresponding HTTP response.

NOTE 5: For the redirections of POST requests, the PP should also be able to handle the 303 status code.

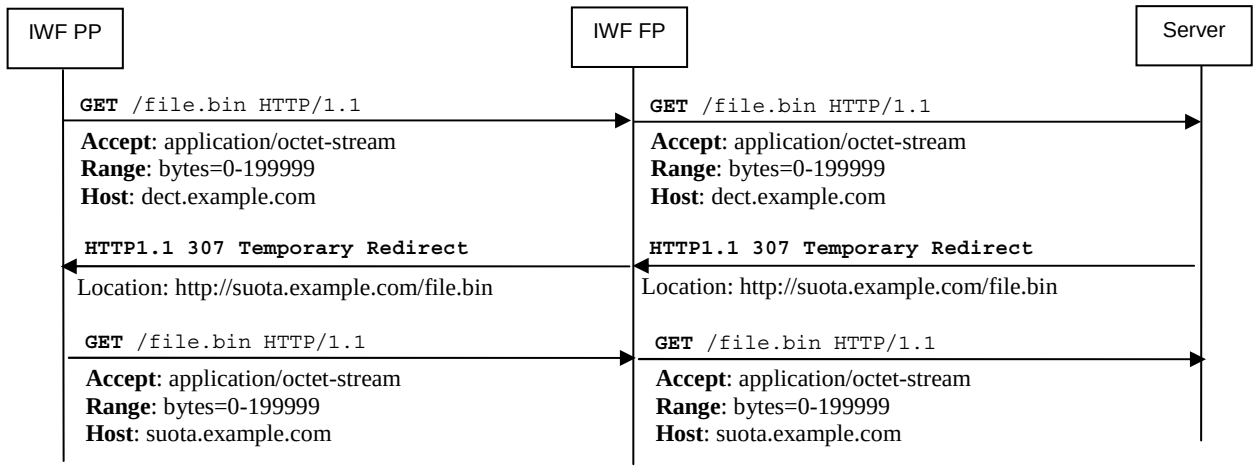

Figure A.1: Example of redirection handled by the PP

NOTE 6: A redirection in general may also change the name of the file to be retrieved. This is however not recommended for the "Binary Content download" feature (file oriented feature).

The FP shall not handle redirections on behalf of the PP.

A.1.7 Byte-range operations

Resource: A file available over the Internet at a location specified by a URI.

Byte-range: A connex subset (interval) of the requested resource considered as a series of bytes. More specifically, a byte range is defined as a sub-interval of [0, (L-1)], where "L" is the total length of the resource.

HTTP1.1 byte-range mechanism shall be used systematically by the PP in order to:

- limit the number of bytes received as a response to a single HTTP request;
- resume the downloading of a resource following a broken connection.

As a restriction to HTTP1.1 a PP shall only request a single range of bytes in any byte range request.

NOTE: For low-memory FPs, the HTTP server hosting DECT specific content to be downloaded should also implement range requests.

The PP and the FP shall implement the following subset of HTTP 1.1 byte range operations.

A.1.7.1 Byte-range operations related responses

206 Partial Content: (RFC 2616 [22], section 10.2.7). This is the response for a successful byte range request (instead of "200 OK").

NOTE 1: A response with status code 206 should not include a Content-Range header with "*" as the response range specifier, as in: `Content-Range: byte */200000`.

416 Requested Range Not Satisfiable: (RFC 2616 [22], section 10.4.17). This is to be used when none of the requested ranges has a non-empty intersection with the targeted resource.

NOTE 2: A 416 response should include a Content-Range header one of the following forms:
`Content-Range: byte */L`, where L is the total length of the resource.
`Content-Range: byte */*`, if the length of the resource is unknown.

A.1.7.2 Byte-range operations related header fields

HTTP1.1 defines the following range request related headers.

Range (from PP to FP): This is the header used by a PP to make a byte-range request. As a restriction to HTTP1.1 "Range" header format, the PP shall always request a single range at most.

NOTE 1: The use of this header by the FP to retrieve resources from the network is out of the scope of the present specification and is not affected by this restriction. The FP should also use this mechanism toward the network in order to cope with its own limited byte rate or memory resources.

Content-Range (from FP to PP): This header shall be used by the FP to specify the actual range of bytes sent as a response to a byte-range request.

NOTE 2: The actual content range may be smaller than the requested one.

NOTE 3: HTTP 1.1 requires that a Content-Length header be also sent along with the Content-Range header (redundant information).

Accept-Ranges (from FP to PP): If present from FP to PP, this header shall always have the value "bytes" (default value), indicating to the PP that range requests are accepted. It shall never have the value "none".

NOTE 4: For low-memory FPs, the HTTP server hosting DECT specific content to be downloaded should implement range requests for all available resources and never use the "Accept-Range: none" value .

If-Range: Not supported.

A.1.7.3 Byte range operation use cases

This clause describes the HTTP message flows for various use cases.

NOTE: For the sake of simplicity:

- DECT messages are left out. Each following "GET" message can be part of the same or of a newly established DECT connection.
- FP to servers exchanges conform to the scenario described in clause B.3 (almost transparent FP).

A.1.7.3.1 Use case 1: standard downloading with default application packet size of 12 kbytes

In the following use case, an image file of 120 kbytes is downloaded using ten HTTP GET commands with HTTP packet size set at the default value of 12 kbytes by means of the RANGE parameter.

Table A.2: Use case 1 sizes

Size of file to be downloaded	120 000 bytes
Maximum HTTP packet size over air i/f	12 000 bytes
Maximum HTTP packet size over network i/f	12 000 bytes

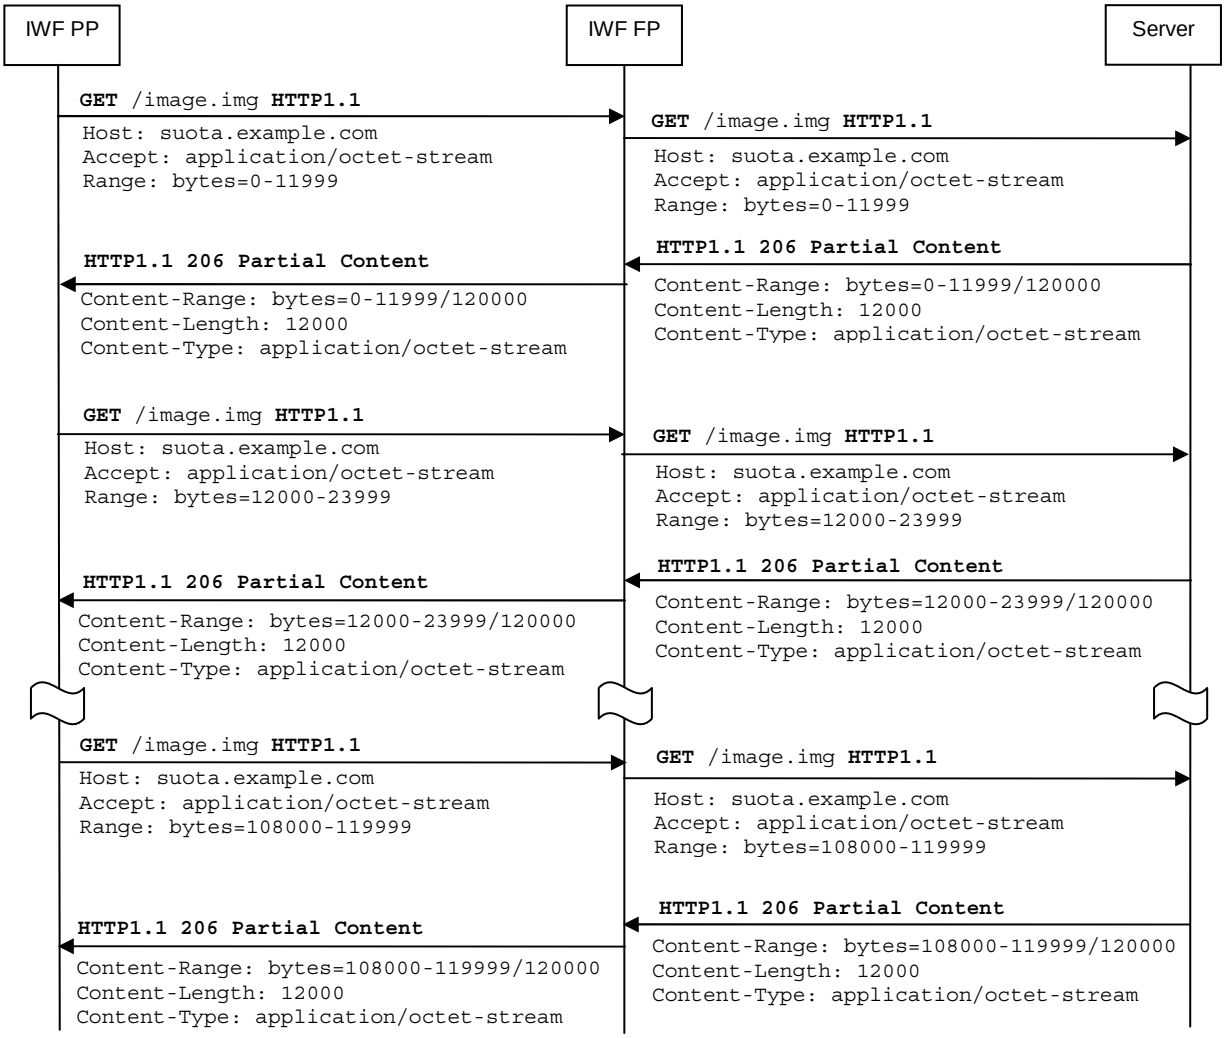

Figure A.2: Use case 1: standard downloading with default application packet size of 12 kbytes

A.1.7.3.2 Use case 2: standard downloading with application packet size of 48 kbytes

In the next use case, both peers have announced the support of a maximum application packet size of 48 kbytes (or possibly larger) in the <<SETUP CAPABILITY>> IE, by means of DPRS-N.33 "Dynamic parameters allocation".

The same image file of 120 kbytes is downloaded using three HTTP GET requests with a range width of 48 kbytes.

Table A.3: Use case 2 sizes

Size of file to be downloaded	120 000 bytes
Maximum HTTP packet size over air i/f	48 000 bytes
Maximum HTTP packet size over network i/f	48 000 bytes

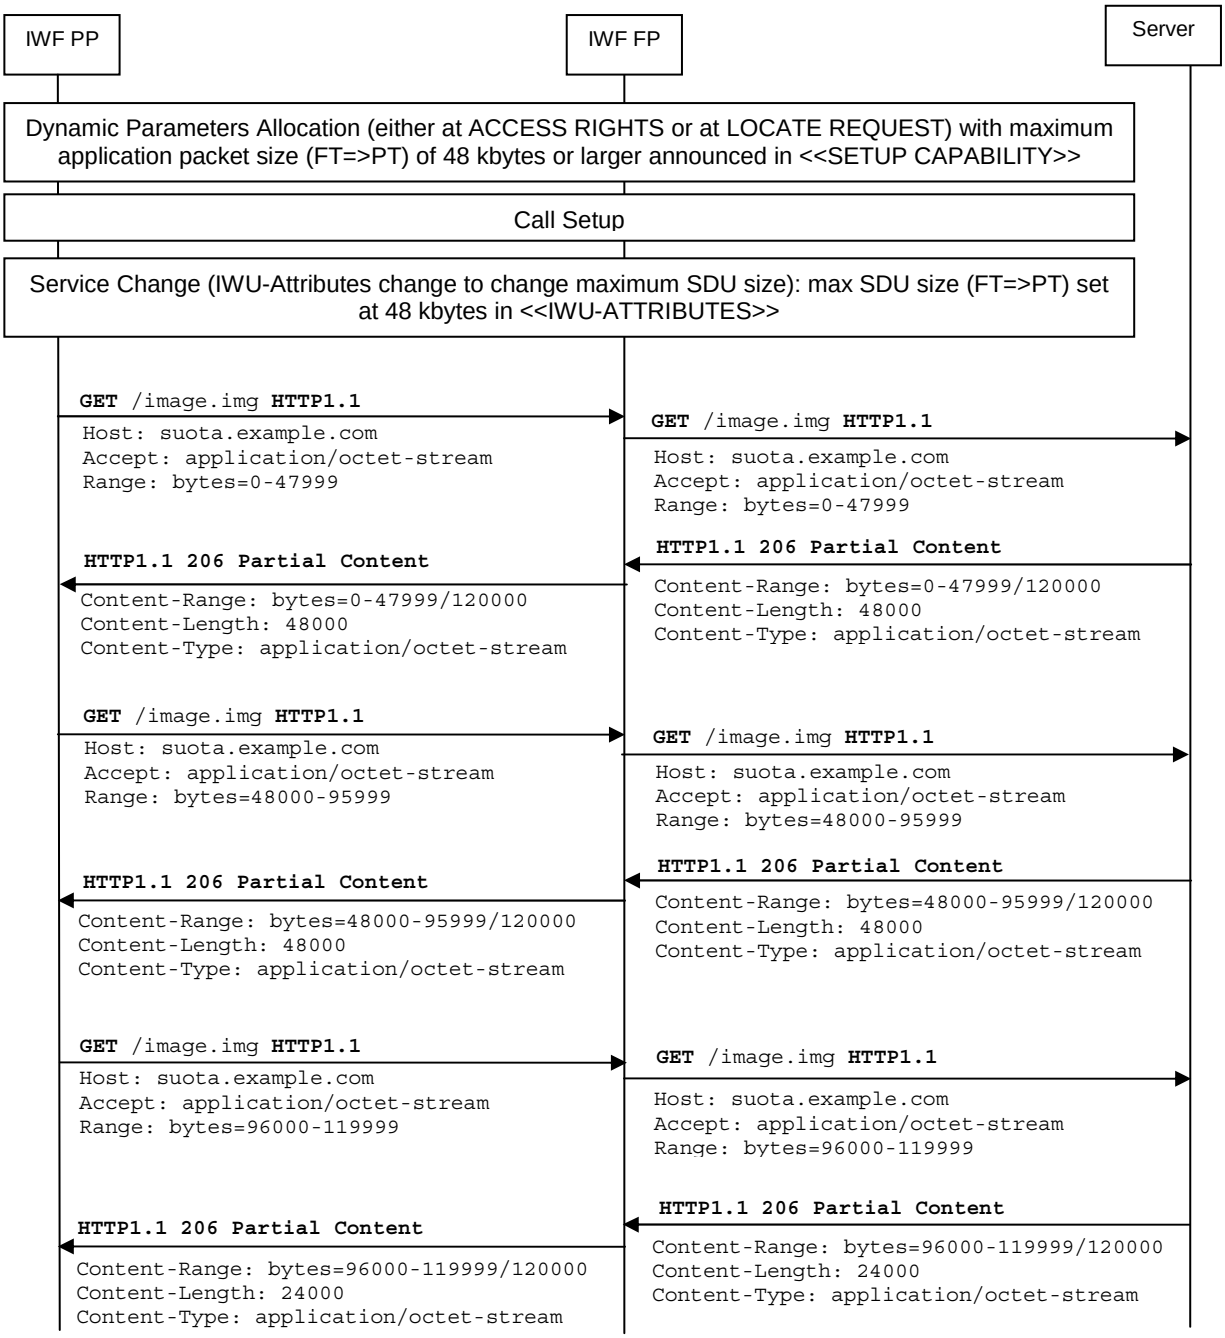

Figure A.3: Use case 2: standard downloading with application packet size of 48 kbytes

A.1.7.3.3 Use case 3: Download with interruption in-between

In this use case, a connection break down makes it necessary for the PP to issue the interrupted GET request again (see also "file downloading resumption" in clause 7.6.1.4).

Table A.4: Use case 3 sizes

Size of file to be downloaded	120 000 bytes
Maximum HTTP packet size air i/f	12 000 bytes
Maximum HTTP packet size over network i/f	12 000 bytes

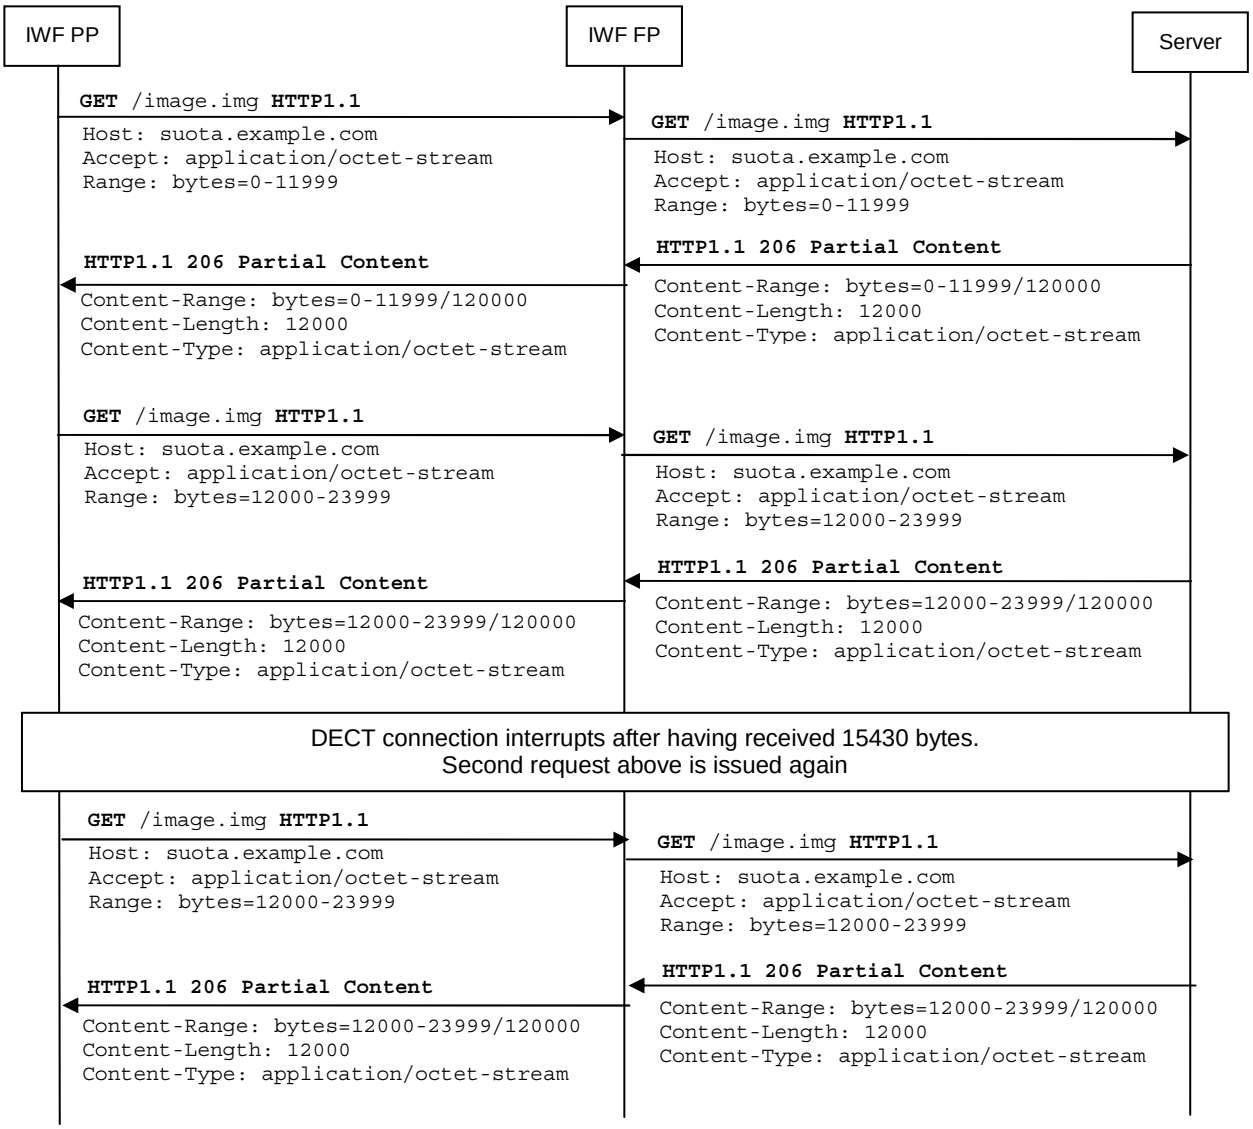

Figure A.4: Use case 3: Download with interruption in-between

A.1.8 Supported HTTP errors

The PP shall be prepared to receive HTTP status codes related to client errors (of the form 4XX) or server errors (of the form 5XX) and shall not crash as a result.

NOTE 1: Both client or server error codes are originating from the server as a response to a request. The server is supposed to know which side the error comes from.

NOTE 2: Redirection (3XX) status codes to be supported are documented in clauses A.1.6 and A.2.2.2 (for PPs implementing clause A.2).

NOTE 3: See RFC 2616 [22], section 10, "Status Code Definitions" for a list of status codes. Note however that this RFC does not list all existing codes. See for example RFC 2817 [24], section 7.1.

A.2 Extended HTTP profile (HTTP limited set nr.3)

NOTE 1: The "Extended HTTP profile" is the HTTP limited set nr. 3 listed in DPRS (EN 301 649 [15], clause B.8.3.5). The name "Common HTTP profile" is used locally in the present document.

The "Extended HTTP profile" defined in the present annex defines a strict superset of the "Common HTTP profile" defined in clause A.1 and is designed for applications requiring higher interactivity between the user and the application.

NOTE 2: The "Common HTTP profile" limits user inputs to the server to URLs values. The "Extended HTTP profile" allows to send parameters or other data to the server.

NOTE 3: The "Extended HTTP profile" is referenced in:

- The **"Binary content download"** feature (see clause 7.6.1.6).
- The **"HTTP-based applications"** feature (7.6.3).

A.2.1 General requirements

A PP and FP implementing the "Extended HTTP profile" shall implement the "Common HTTP profile" as a pre-requisite.

The "Extended HTTP profile" implies implementation of the POST method with the "Post Redirect Get" pattern" (clause A.2.2.2.2).

A FP implementing the "Extended profile" shall be able:

- to support the reception of a POST request of at least 1 500 bytes from the PP.
- to forward such a POST request (received from the PP) to the server.
- to forward the server response to the PP.

A PP or FP implementing the "Extended HTTP profile" shall be able to support a POST response of at least 1 024 bytes.

NOTE: The server should either respect this limit for the response, or redirect the POST request as defined in clause A.2.2.2.2.

A.2.2 POST method

This clause describes the use of HTTP 1.1 POST method within the "Extended HTTP profile". This method is provided in addition to the partial GET method (see clause A.1) for allowing PP to FP sending of data (i.e. not limited to the sending GET requests).

A PP implementing the POST method feature shall support the POST method with media type "multipart/form-data".

NOTE 1: The POST method is most notably useful for sending HTML completed forms (see also clause 7.6.3.6.3) to the server. However, the user interface for sending user entered data may be any type of user interface and need not be HTML forms.

NOTE 2: The "multipart/form-data" format is known to properly handle character encodings, contrary to GET "query string" method(s) or related "x-www-form-urlencoded" POST method, for sending completed form data.

A.2.2.1 Example of POST method

Example of form sending	Comments
POST /dect/service1 HTTP/1.1‘0d0a’H **Accept**: text/html‘0d0a’H **Content-Type**: multipart/form-data; boundary=----7d81‘0d0a’H **Host**: example.dect.com‘0d0a’H **Content-Length**: xxx‘0d0a’H ‘0d0a’H ----7d81‘0d0a’H **Content-Disposition**: **form-data**; name="Firstname"‘0d0a’H **Content-Type**: text/plain;charset=UTF-8‘0d0a’H ‘0d0a’H ‘c389’Hric‘0d0a’H ----7d81‘0d0a’H **Content-Disposition**: **form-data**; name="Lastname"‘0d0a’H **Content-Type**: text/plain;charset=UTF-8‘0d0a’H ‘0d0a’H Leb‘c593’Huf’0d0a’H ----7d81--‘0d0a’H	‘0d0a’H = carriage return + line feed (always) The used boundary between form entries is defined here A ‘blank line’ must be present here A ‘blank line’ must be present here ‘Éric’ was entered on a UTF-8 compliant device A ‘blank line’ must be present here ‘Lebœuf’ was entered on a UTF-8 compliant device The last boundary line must end with two hyphens (‘--’)

Figure A.5: Example of POST method

NOTE 1: Considering the POST request as a series of bytes, the following notation has been used in the above example:

- bytes corresponding to printable US-ASCII characters are represented by the corresponding character.
- hexadecimal notation has been used for non-ASCII characters, and for ASCII but non-printable characters (i.e. carriage return character '0D'H and line feed character '0A'H).
- white spaces within request and header lines always stand for the single byte '20'H (no other encoding should be used for white spaces at these places).

NOTE 2: A POST request can also send binary data-or data considered as binary data-to the server (e.g. a file), although this is not shown in the above example.

A.2.2.2 Redirection of POST requests

A.2.2.2.1 General requirements

As an addition to clause A.1.6, the present clause handles the redirection of POST methods.

The PP shall be able to handle redirections of POST requests with the following status codes:

- 302, "Found". In the context of a POST request, the PP behaviour shall be identical to as when 303 is used.
- 303, "See Other". The redirection target url ("Location" header value) shall be requested with a **GET** request (and not POST). If subsequent requests to the same initial url are planned, the PP shall however still use the initial url.
- 307, "Temporary Redirect". If subsequent requests to the same initial url are planned, the PP shall however still use the initial url (e.g. for the case the redirection target would change in between).

A.2.2.2.2 Post-Redirect-Get pattern

The Post-Redirect-Get pattern is known to allow adequate user experience when sending form data to a server.

In the case of a DECT PP, it also allows the use of a partial GET request by the PP (as described in clause A.1.7) to retrieve the POST response.

Use of this pattern is initiated by the server which redirects the client instead of sending the POST response directly. The client retrieves the response by issuing a subsequent GET (partial) request as the result of the redirection.

The server should either use this pattern to handle POST requests, or respect the limit defined in clause A.2.1 for the size of the response.

NOTE: The most adequate http redirection code to be used in this case is "303 See Other".

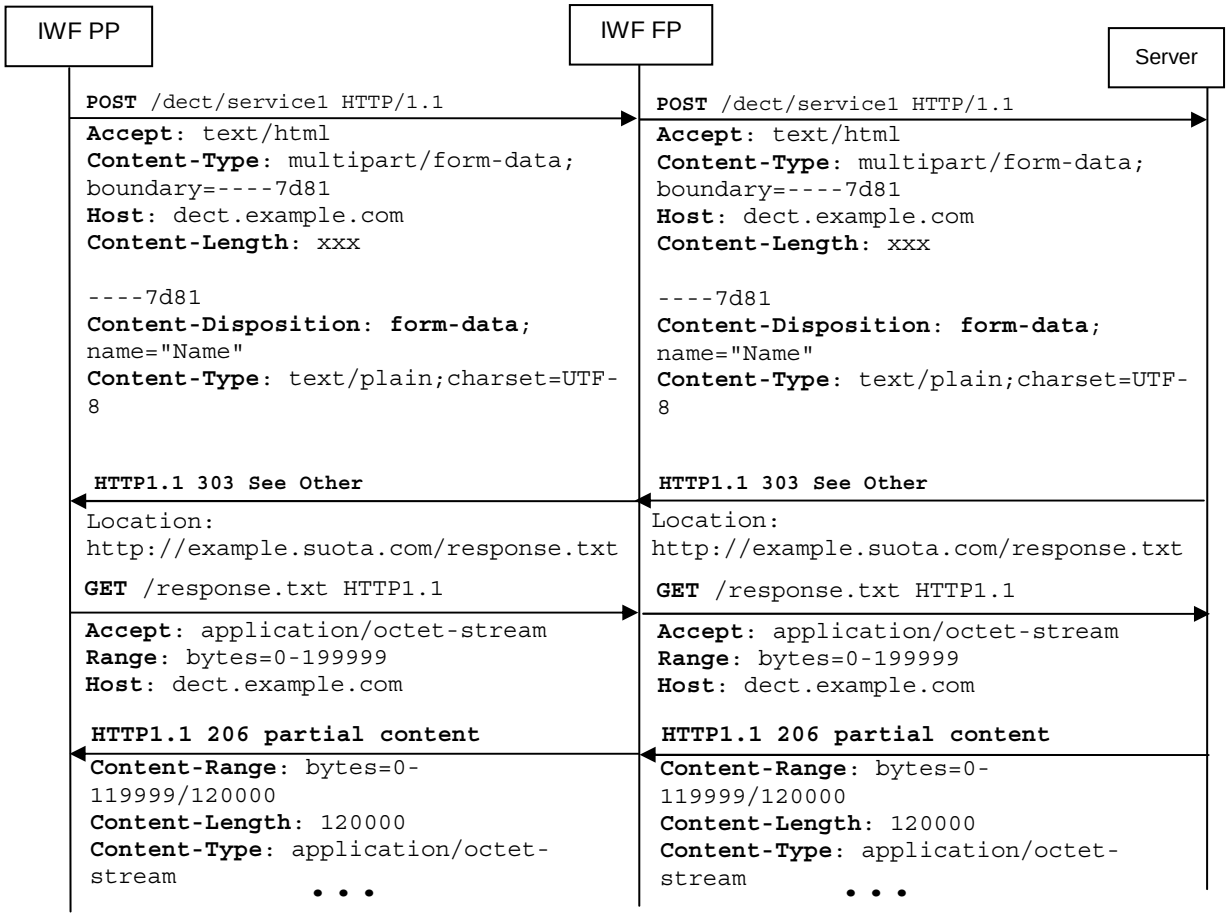

Figure A.6: Post-Redirect-Get pattern

A.2.3 Supported HTTP header fields

Table A.5: Supported HTTP hearer fields

Name	Direction	PP status	FP status	Normative action/comment
User-Agent	PT to FT	M	CA201	The value for version Part4 version 1.1.1 shall be: NG-DECT-Part4/1.1.1 (A.1; A.2) See also clause A.1.4
CA201: IF the FT plays the server role THEN M ELSE N/A.				

Annex B (normative): Basic SUOTA

Clauses B.1 and B.2 describe the Basic SUOTA interface to the MS, used by the FP. This interface shall be implemented by the FP and must be implemented by NG-DECT Part4 compliant management servers.

NOTE 1: Basic SUOTA is defined end-to-end up to the MS and DS. This allows to handle (at least) the SUOTA "pure" cross-vendor case, involving a PP and FP from different vendors, and for which the PP is unknown to the FP.

NOTE 2: The use of this interface is described in clause 7.6.2.2.2, "Step 2- FP retrieves downloading information from management server".

NOTE 3: This interface could also be used for software/firmware upgrade of the FP itself.

Clause B.3 describes a software upgrade example using Basic SUOTA.

NOTE 4: Although annex B is normative, clause B.3 only describes an example implementation and is therefore informative.

B.1 Basic SUOTA FP to management server interface

The purpose of the "Basic SUOTA FP to management server interface" described in the present clause is to allow the FP to request the files urls needed for a given software upgrade (see step 2, clause 7.6.2.2.2).

FP_URL1. Name of the FP request to the management server. For the "Basic SUOTA FP to management server interface", this request takes the form of a URL with parameters in the "query string".

The FP requests all needed file urls at once (i.e. in a single FP_URL1 request). File urls are supposed to be delivered by the management server in the order they are needed by the PP for the actual software upgrade, from 1 to N_f.

B.1.1 FP request (FP_URL1) construction

In order to construct FP_URL1, the FP shall append the following strings to URL1:

- **<linking character>**: "?" or "&" or nothing; more specifically, a question mark ("?") shall be used if the base url does not contain this character; otherwise, an ampersand "&" shall be used if "?" is not the terminating character of the base url; otherwise, the linking character shall be absent.
- "**EMC=**"<coded Equipment Manufacturer's Code value, 4 hexadecimal characters (see note 1)>.
- "**&SWVid=**"<coded Software Version id value, less than 40 hexadecimal characters (see note 1) >.
- "**&HWVid=**"<coded Hardware Version id value, less than 40 hexadecimal characters (see note 1) >.

NOTE: These values are copied from the "Handset version indication" command received from the PP and coded as printable **hexadecimal** strings. Leading zeros are optional.

In order to construct FP_URL1, the FP may in addition append the following strings to URL1, and **shall** do it if it is not using the default value for the corresponding parameters:

- "**&reason=**"<reason value from "Handset version indication", 1 hexadecimal character, default value '0'H>.
- "**&UIS=**"<User initiated SUOTA value = bit 5 of octet 8a in "Handset version indication", default value '0'B>.

If the reason field is not zero (and therefore necessarily present in FP_URL1), the FP shall in addition add the following string to URL1:

- "**&fileNumber**="<fileNumber field value from "Handset version indication", 1 hexadecimal character>.

EXAMPLE: if URL1= "http://suota.example.com/info", FP_URL1 computed as above could be:

- "http://suota.example.com/info?EMC=01ab&SWVid= 4649524d574152452d312e322e30&HWVid=322e32, in order to ask for download information concerning the version **next to** "FIRMWARE-1.2.0", and provided that the <EMC> and <HW Version identifier> values received in the "Handset version indication" command were respectively '01ab'H, '322E32'H.

- "http://suota.example.com/info?EMC=01ab&SWVid=4649524d574152452d312e322e30&HWVid=322e32 &reason=2&fileNumber=2, to report a failure when applying file number 2 under the same conditions.

B.1.2 Private parameters

FP_URL1 may include one or more private parameter(s), if the following conditions are met:

- the FP including these parameters know the MS and knows the MS requires or accepts these parameters;
- each parameter name is different from all of the parameters defined in clause B.1.1.

NOTE: For example, an MS specific PP and/or FP device id may be inserted for device management purposes.

B.2 Basic SUOTA management server to FP interface

A management server complying with the SUOTA DECT specific interface shall answer the FP request with a "application/xml" value for the **Content-Type** header.

```
<?xml version="1.0" encoding="utf-8"?>
<SUOTA>
   <!-- total size in bytes of all files (present or absent in the list below) -->
    <SoftwareTotalSize>201927</SoftwareTotalSize>

    <!-- software version id of the file set (printable hexadecimal coded) -->
    <SoftwareVersionId>312e3131</SoftwareVersionId>

    <!-- yes or no; if yes, download should only start upon user authorisation -->
    <UserInteraction>no</UserInteraction>

    <!-- Delay suggestion (in min) before download should start
         between 0 and 65535 minutes -->
    <DelayMinutes>300</DelayMinutes>

    <!-- list of all files needed for the upgrade
         between 1 and 15 files, in the order needed for the upgrade -->
    <FileList>
       <File>http://suota.example.com/path/to/file/file1.bin</File>
       <File>http://suota.example.com/path/to/file/file1.md5sum</File>
       <File>http://suota.example.com/path/to/file/file2.bin</File>
       <File>http://suota.example.com/path/to/file/file2.md5sum</File>
    </FileList>
</SUOTA>
```

Figure B.1: Example of management server returned information following a FP request

The document element shall be named "SUOTA" and shall contain the following sub-elements:

- **SoftwareTotalSize:** total size of the new software (added sizes of all files, present or not in the file list); decimal coded. In case there is no new software available, the SoftwareTotalSize parameter shall be "0".
- **SoftwareVersionId:** software version identifier of the new software; As the present document makes no provision as to the format of the "Software Version id" parameter, it shall be hexadecimal coded.
- **UserInteraction:** parameter indicating that the user authorization should be received before the download starts (value: "yes" or "no", without the quotes).
- **DelayMinutes:** (in minutes, from 0 to 65 535). This value is to be used for the first file of the list (As the PP downloads files sequentially, the next files will have most of the time a DelayMinutes parameter of "0". See clause 7.5.5.2.2).
- **FileList:** List of file urls, each of which being included in a sub "File" element.
  - In case there is no new software available, the <FileList> element shall still be present, and shall be empty.
  - File urls shall be listed in the order they are needed by the PP for the actual software upgrade. In case several orders are acceptable for the PP, the MS shall nevertheless always use the same order.

The MS shall respect the order of the elements specified above, and shall not add extra information, such as attributes or elements not specified above.

The FP shall respect the order of the urls in the list, i.e. shall send them in "Handset Version available" commands in the same order.

B.3 Basic SUOTA possible implementation (example)

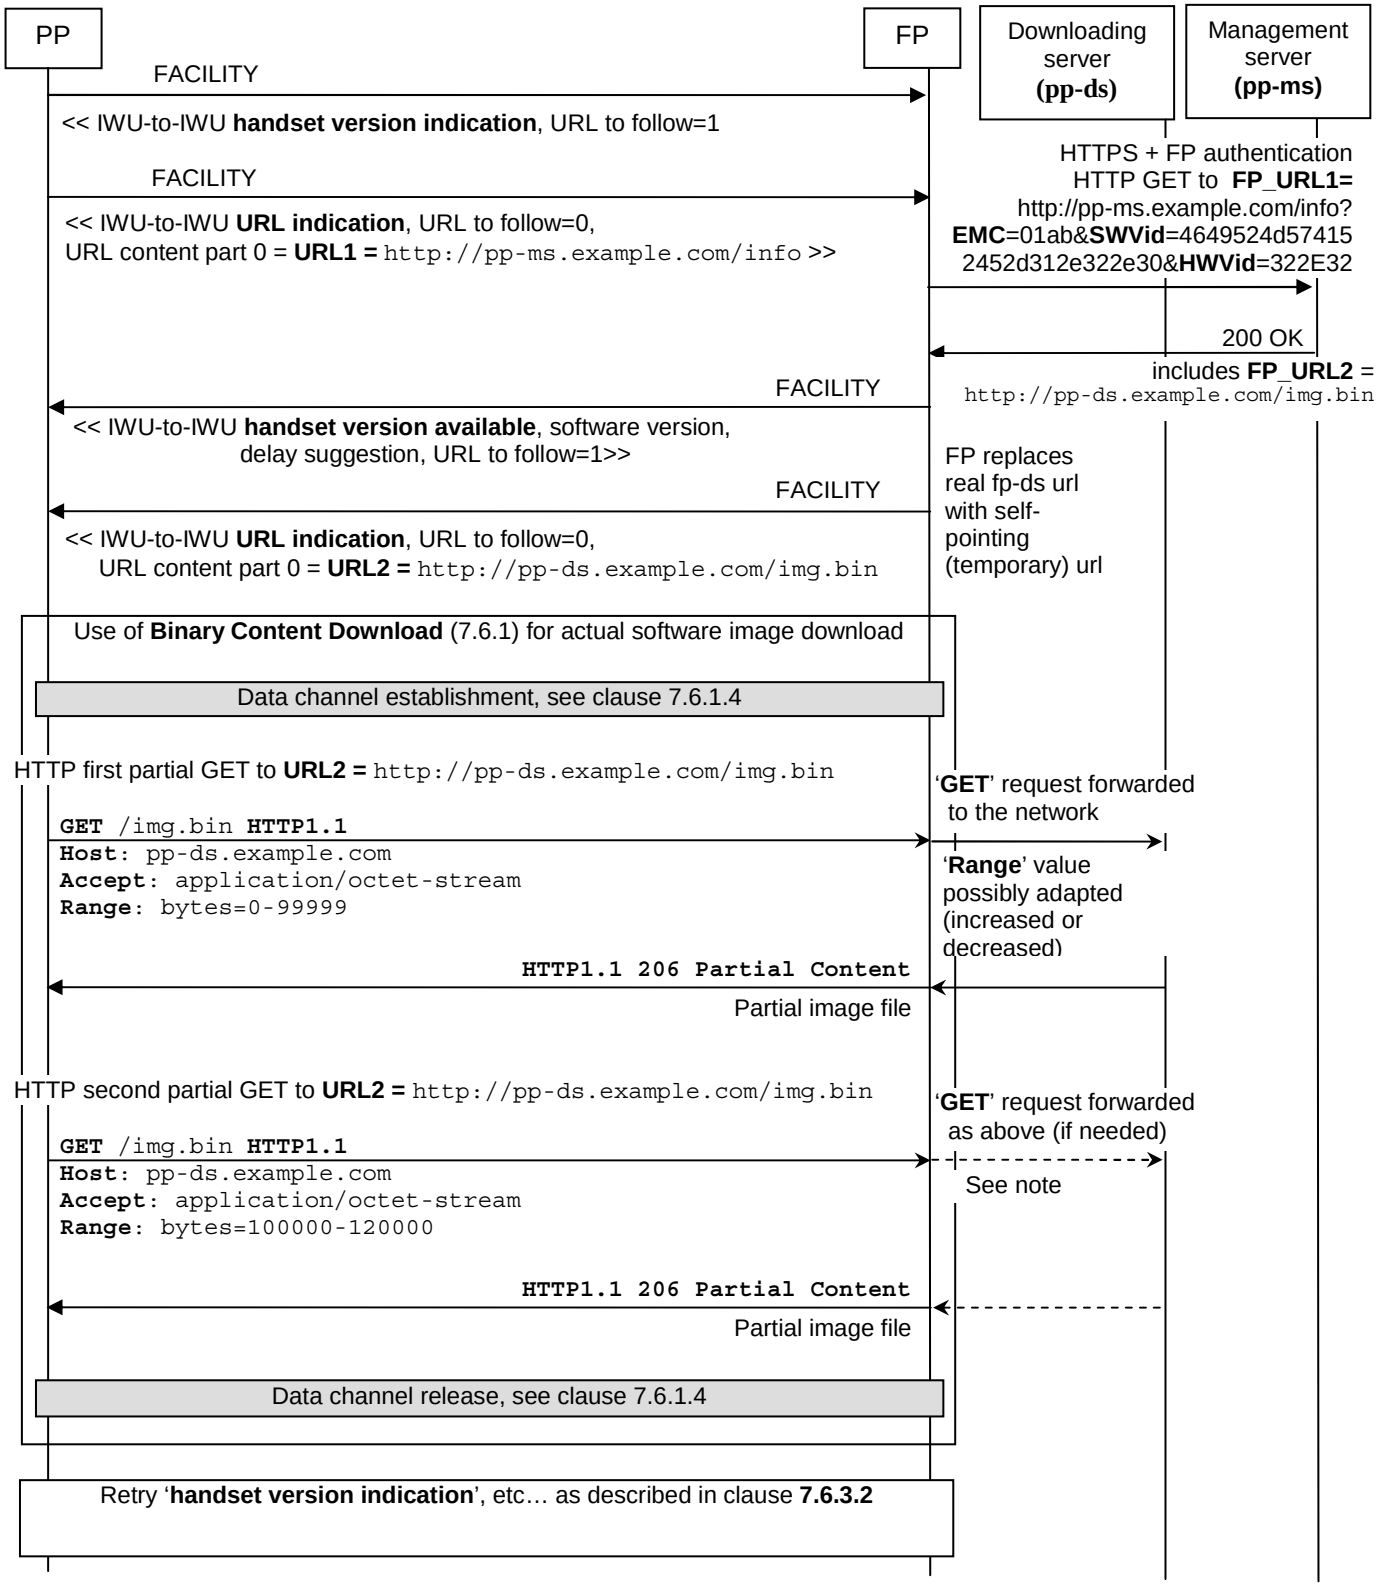
Clause **B.3** details a possible implementation of Basic SUOTA as described in clause 7.6.2.2.

Thanks to the information received from the PP in the "Handset version indication" and "URL indication" commands (especially URL1):

- The FP creates FP_URL1, by appending PP specific parameters (received in "Handset version indication") to URL1 (received in "URL indication"). See clause B.1.
- The FP contacts the PP-vendor management server (pp-ms) on behalf of the PP and retrieves the software upgrade information there, in the format described in clause B.2.
- The FP forwards to the PP the retrieved FP_URL2 unchanged (FP_URL2 = URL2) in the "Handset version available" command. In this example, only one file is needed for the upgrade.

The PP establishes a "Binary content download" connection with the FP and sends HTTP partial GET requests to the FP:

- The FP forwards almost transparently the PP partial GET requests to the DS.
- For a given partial GET request from the PP, the FP may retrieve a smaller or larger range of the target resource than requested by the PT, thus adjusting it to its own memory or rate constraints.



NOTE: For a given partial GET request from the PP, the FP may retrieve a smaller or larger range of the target resource than requested by the PT, thus adjusting it to its own memory capacity. In some cases this second retrieval step towards the network may therefore not be necessary.

Figure B.2: Example of Basic SUOTA possible implementation

Annex C (informative): Enhanced SUOTA

This annexes illustrates 4 possible uses of Enhanced SUOTA, in clauses C.1, C.2, C.3, and C.4.

C.1 Enhanced SUOTA example-use of Basic/Digest authentication and HTTPS from FP to MS, initiated by the PP

Clause C.1 illustrates one Enhanced SUOTA (clause 7.6.2.3) use case: the use of two enhanced features (https + basic or digest http-based authentication from FP to MS) requested by the PP using security requirements as described in clause 7.6.3.4, "PP security requirements in URL1 and URL2".

In this example, use of security features from FP to MS implies the use of the same security features for the download of the file itself from the DS (i.e. within use of the "Binary content download" feature). This is because the MS- inferring from step 2 that the FP is capable of using security features-answers with FP_URL2 also including the same kind of security requirements.

More specifically, exchanges between the FP and the MS, and between the FP and the DS are protected in the following way:

- Confidentiality is ensured through TLS/SSL encryption between the FP and the server:
  - For software upgrade information, encryption is requested by the PP by using an https request. HTTPS itself is however only used between the FP and the management server.
  - For software image downloading, encryption is requested by the MS by including an https url in the software upgrade information. HTTPS itself is again only used between the FP and the management server.

NOTE: Encryption only relies on the server encryption private and public keys, and corresponding certificate (the FP does not need to own any encryption key). The FP should implement a TLS/SSL stack and embed/trust the public key of the server certificate authority, or of one of its ancestors.

- **PP authentication** is ensured through HTTP basic or digest authentication, operated by the FP on behalf of the PP.

The PP should entrust the FP with its own authentication password, and therefore should trust the FP.

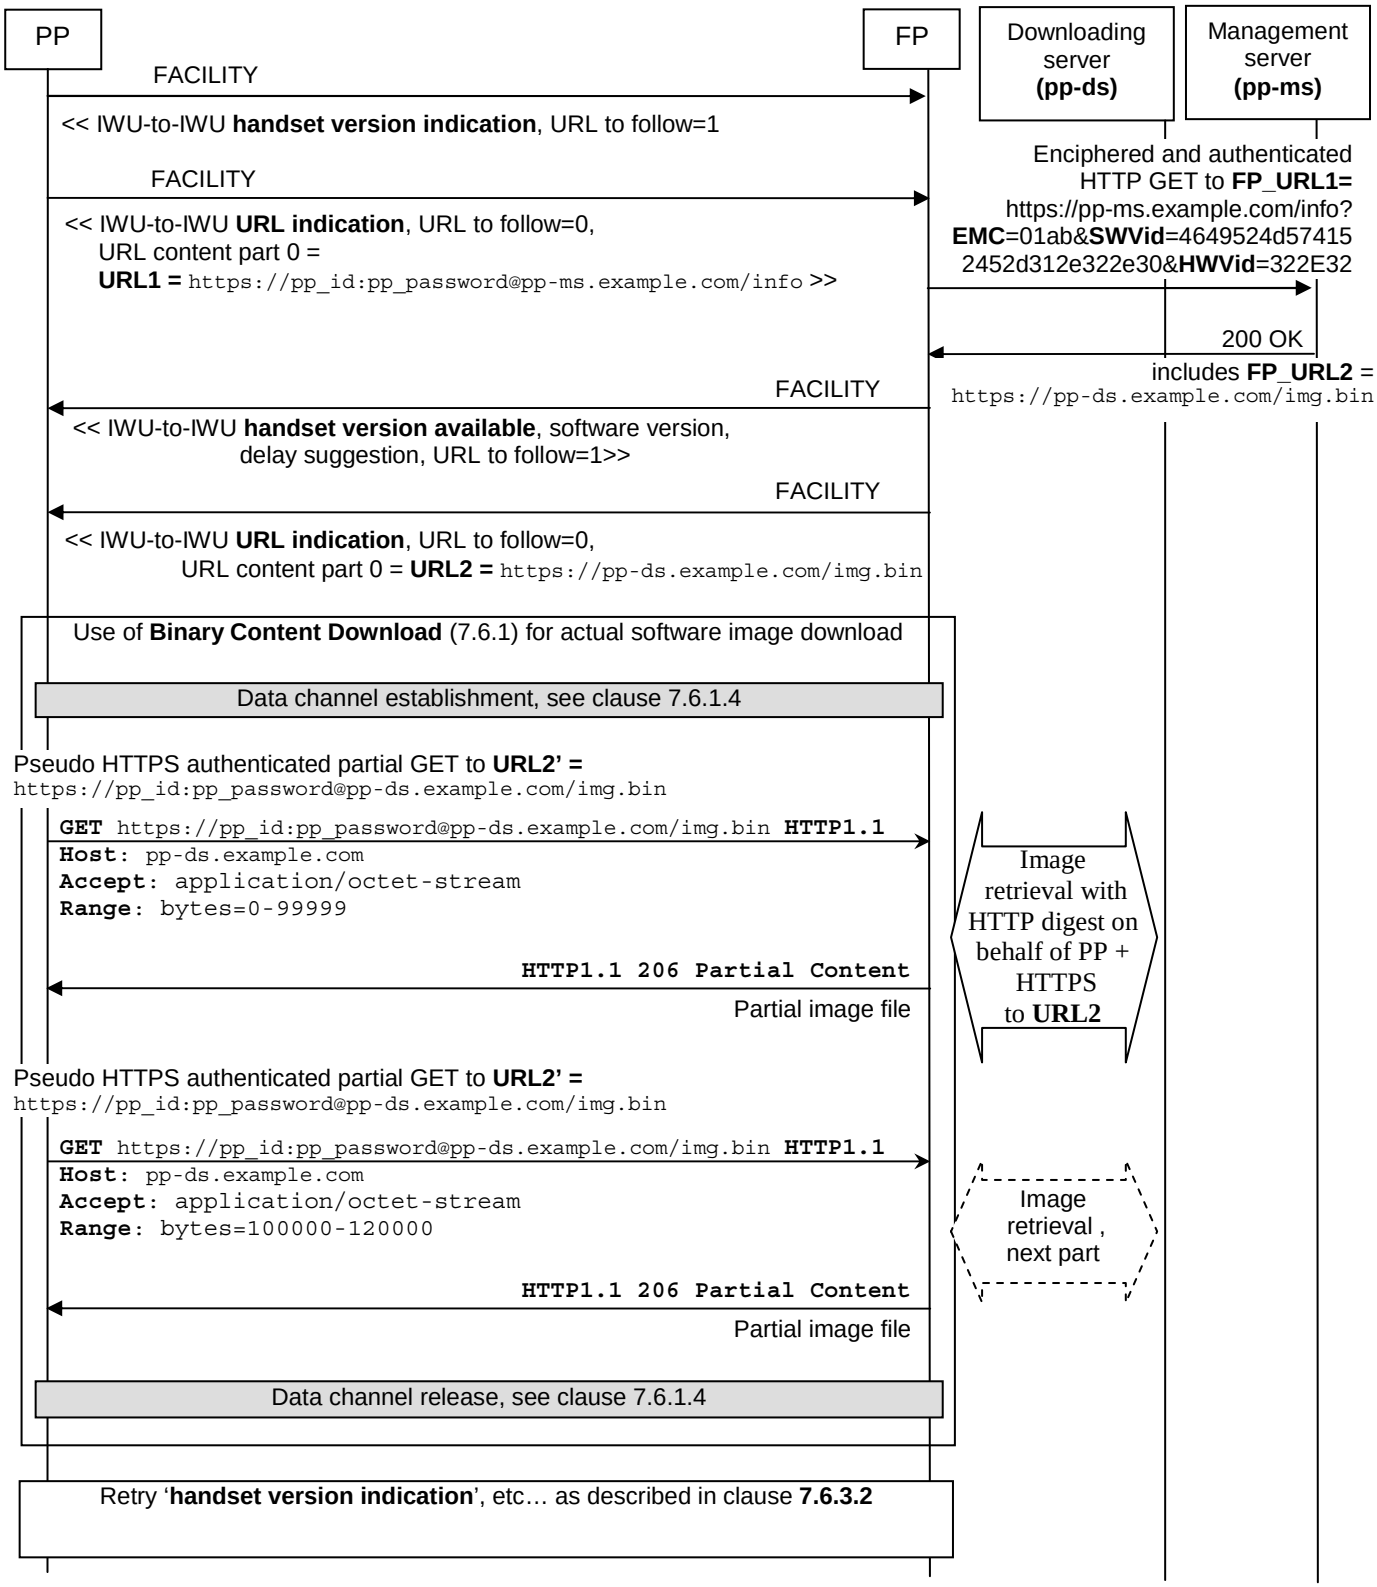


Figure C.1: Example of Enhanced SUOTA-use of Basic/Digest authentication and HTTPS from FP to MS, initiated by the PP

C.2 Enhanced SUOTA example-use of HTTPS from FP to MS, initiated by the MS

Clause C.2 illustrates one Enhanced SUOTA (see clause 7.6.2.3) use case: use of an enhanced feature (https) initiated by the MS.

Enhanced SUOTA is initiated by the MS in step 2, requiring the use of HTTPS toward the server, after receiving a plain http request (FP_URL1 = http://pp-ms.example.com/info?EMC=01ab&SWVid=312E3130&HWVid=322E3237).

Receiving a request to FP_URL1, the MS requires an upgrade to TLS. As a result, HTTPS is used for the FP to MS session, and also for the downloading of files (as in clause C.1).

NOTE: In this example, although Enhanced SUOTA is used, the MS used is still a Basic SUOTA complying MS (using clauses B.1 and B.2 but with security features).

In this example, the URL2 value sent by the FP to the PP is a temporary local URL pointing to the FP itself as described in clause 7.6.2.3.3, "Step 3-Enhanced SUOTA possible variants", the FP acting as local server. Alternatively, if the PP supports security requirements and the FP knows this, the FP could directly send a "distant" URL2 value with security requirements, as in clause C.1).

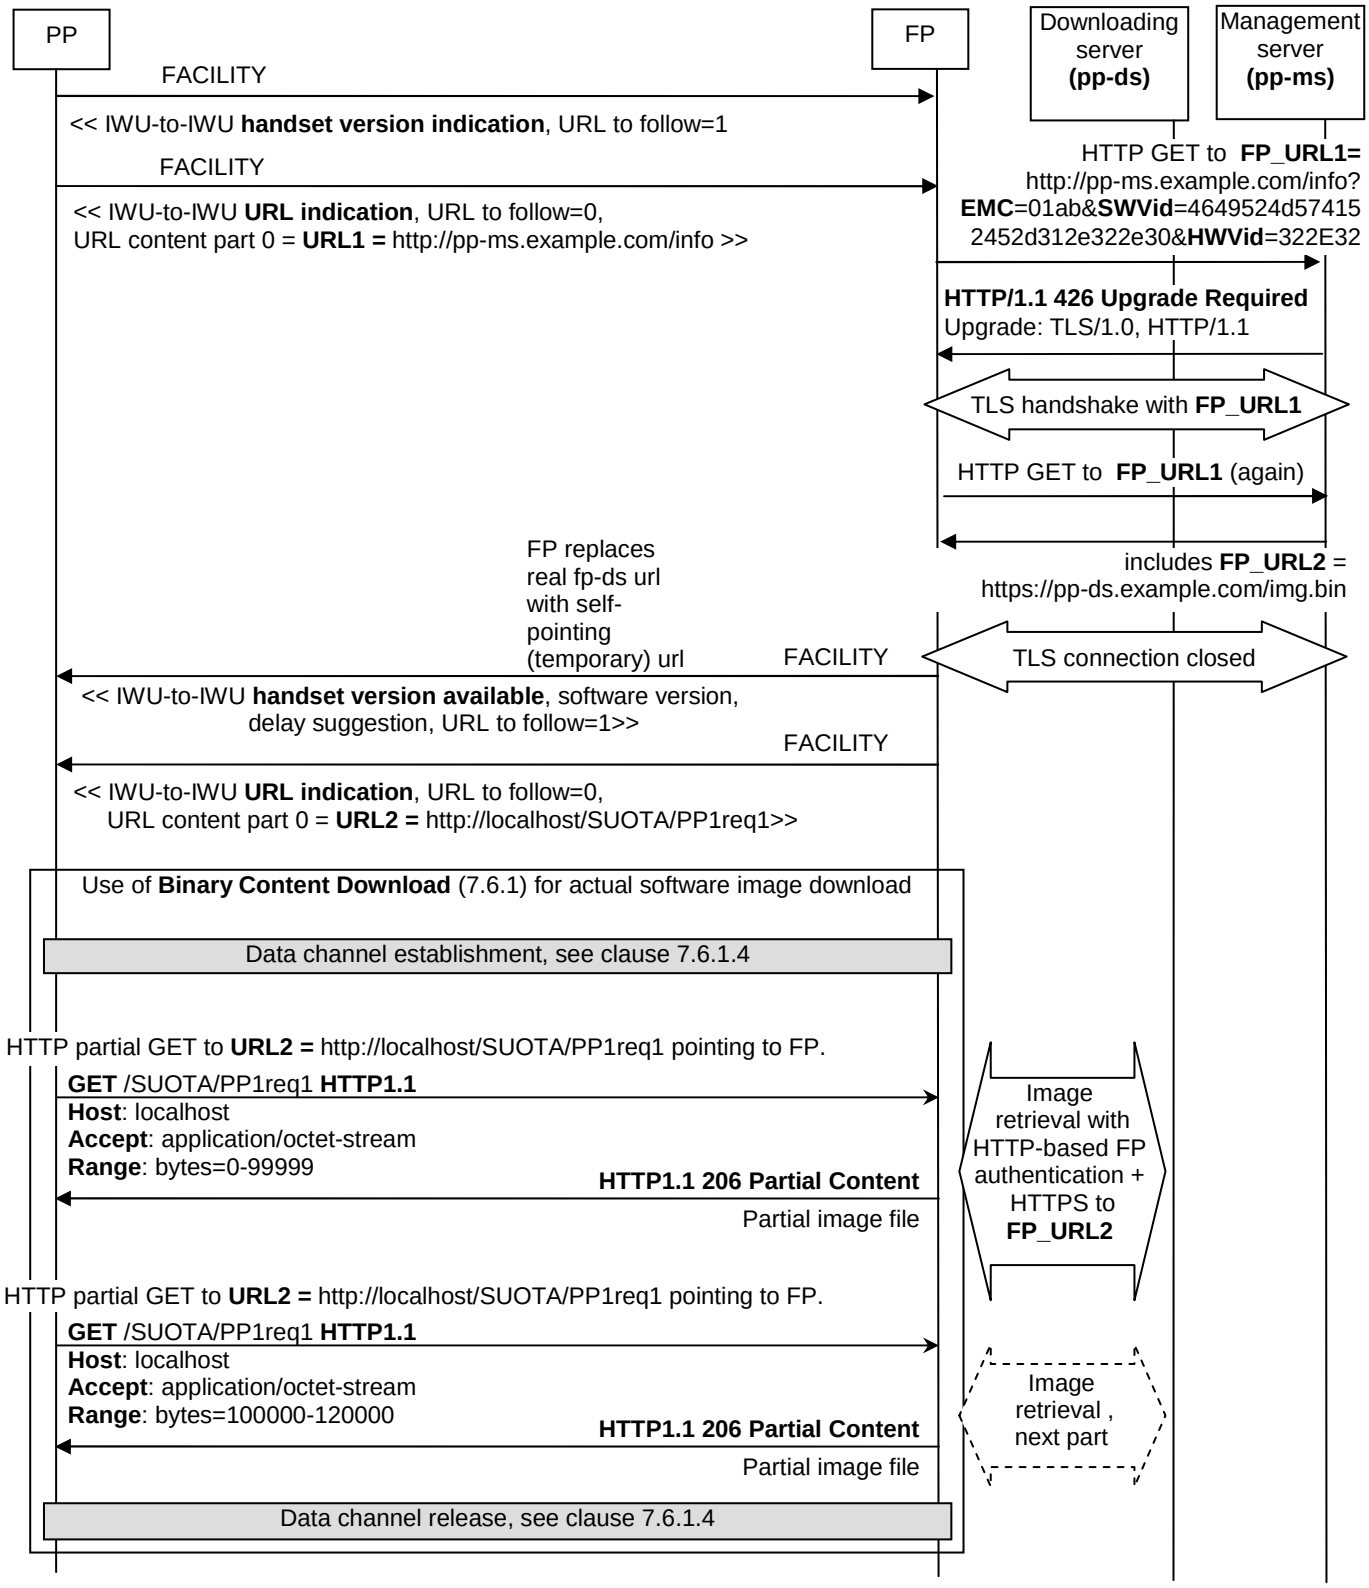

Figure C.2: Example of Enhanced SUOTA-use of HTTPS from FP to MS, initiated by the MS

C.3 Enhanced SUOTA example-use of HTTPS from FP to MS, initiated by the FP

Clause C.3 illustrates one Enhanced SUOTA (see clause 7.6.2.3) use cases: use of an enhanced feature (https) initiated by the FP.

This use case is similar to the one described in clause C.2, because the result is the same: URL1 is used, except that HTTPS is used instead of HTTP. However the way HTTPS use is initiated is different.

In the present example, Enhanced SUOTA is initiated by the FP in step 1, directly setting an HTTPS connection with the MS to pp-ms.example.com because **URL1 =** http://pp-ms.example.com/info is recognized as a known URL1 value (e.g. because pp-ms = fp-ms).

NOTE: In this example again, as in clause C.2, and although Enhanced SUOTA is used, the MS used is still a Basic SUOTA complying MS (using annexes B.1 and B.2 but with security features).

In this example again, the URL2 value sent by the FP to the PP is a temporary local URL pointing to the FP itself as described in clause 7.6.2.3.3, "Step 3-Enhanced SUOTA possible variants", the FP acting as local server. Alternatively, if the PP supports security requirements and the FP knows this, the FP could directly send a "distant" URL2 value with security requirements, as in clause C.1).

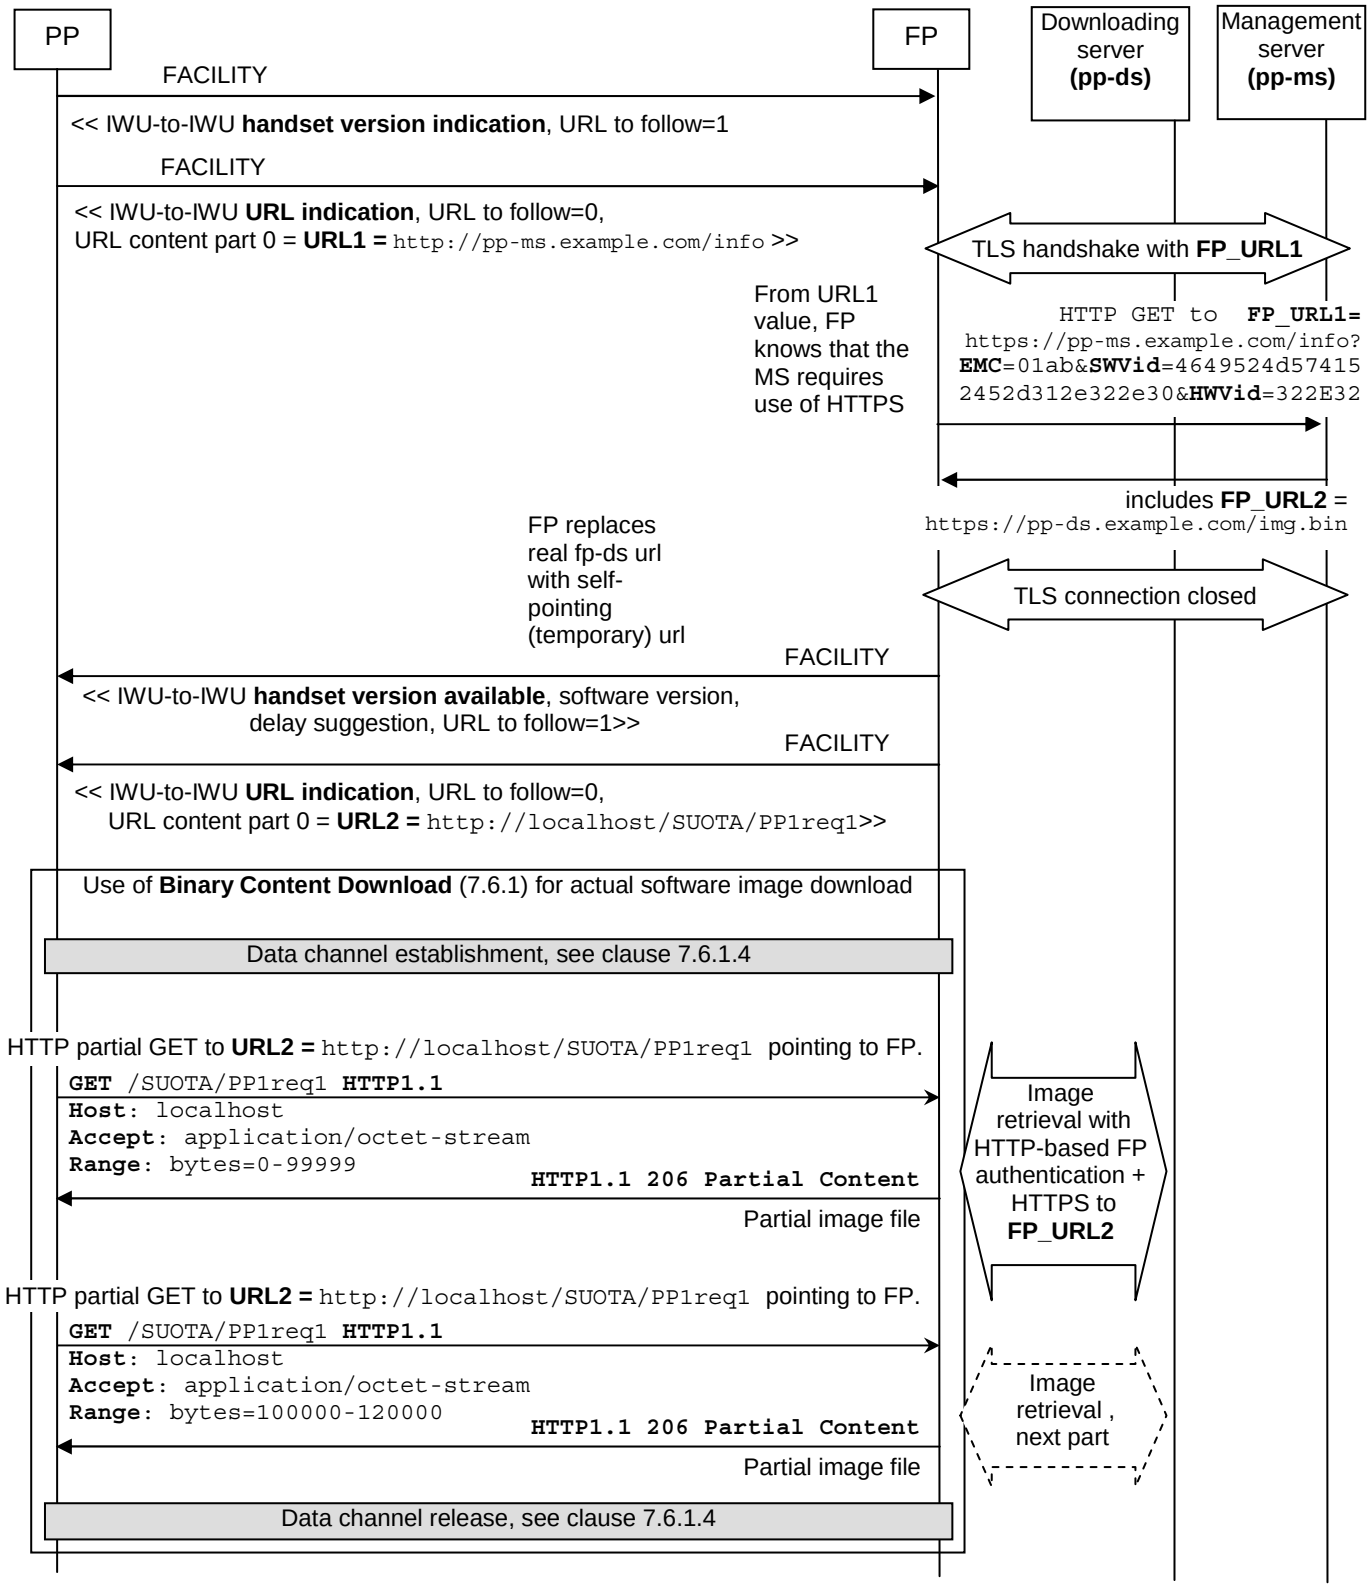

Figure C.3: Example of Enhanced SUOTA-use of HTTPS from FP to MS, initiated by the FP

C.4 Enhanced SUOTA example-use of TR-069 [i.5]

C.4.1 Introduction and diagram

Clause C.4 illustrates one Enhanced SUOTA (see clause 7.6.2.3) use case: the FP triggers the use of TR-069 [i.5], because it knows the MS requires it.

In the present example, the used MS is TR-069 compliant. The FP is the TR-069 client and knows the MS. It uses this MS to manage its own firmware updates, as well as the PPs firmware updates.

NOTE 1: In the context of TR-069 [i.5], the management server is called the "ACS" (Auto-Configuration Server).

The FP to MS connection is enciphered using TLS/SSL. The FP (i.e. the TR-069 client) should authenticate to the management server using either HTTP basic or digest authentication, or a SSL/TLS based strong authentication.

The FP still uses the parameters received in the "Handset version indication" message, but posts them in a TR-069 compliant message to the management server ("Inform" message).

The TR-069 compliant scenario requires the following adjustments to the four "SUOTA protocol steps" described in clauses 7.6.2.2 and 7.6.2.3:

- TR-069 requires the FP (TR-069 client) to notify the MS, for each file, of the correct download and application (e.g. installation). The present example interprets the sending of a "Handset version indication" for fileNumber="n" by the PP as an acknowledgement of correct download and application of file "n-1". This allows the FP to first send a TransferComplete message for file "n-1" in step 2.

- For the sake of clarity, message exchanges between the FP and MS in step 2 are split into two TR-069 sessions. In a real life case, "TransferComplete" message from FP to MS for file "n-1" and "Download" message from MS to FP for file "n" could be exchanged in the same session.

- This example assumes that file url number "n" is received from the MS in the n^{th} use of step 2 (not in the first use of step 2, as it would be the case with Basic SUOTA). This is however not necessarily the case: step 2 could include several download requests from the MS. For example, the MS could send all download requests in the first use of step 2, allowing the FP to get all file urls in one step as for Basic SUOTA.

NOTE 2: TR-069 allows a device to refuse some download requests, using "9004 Resources exceeded" fault message toward the server as described in clause C.4.2.3.3. In that case the MS will repeat this requests during the next connections.

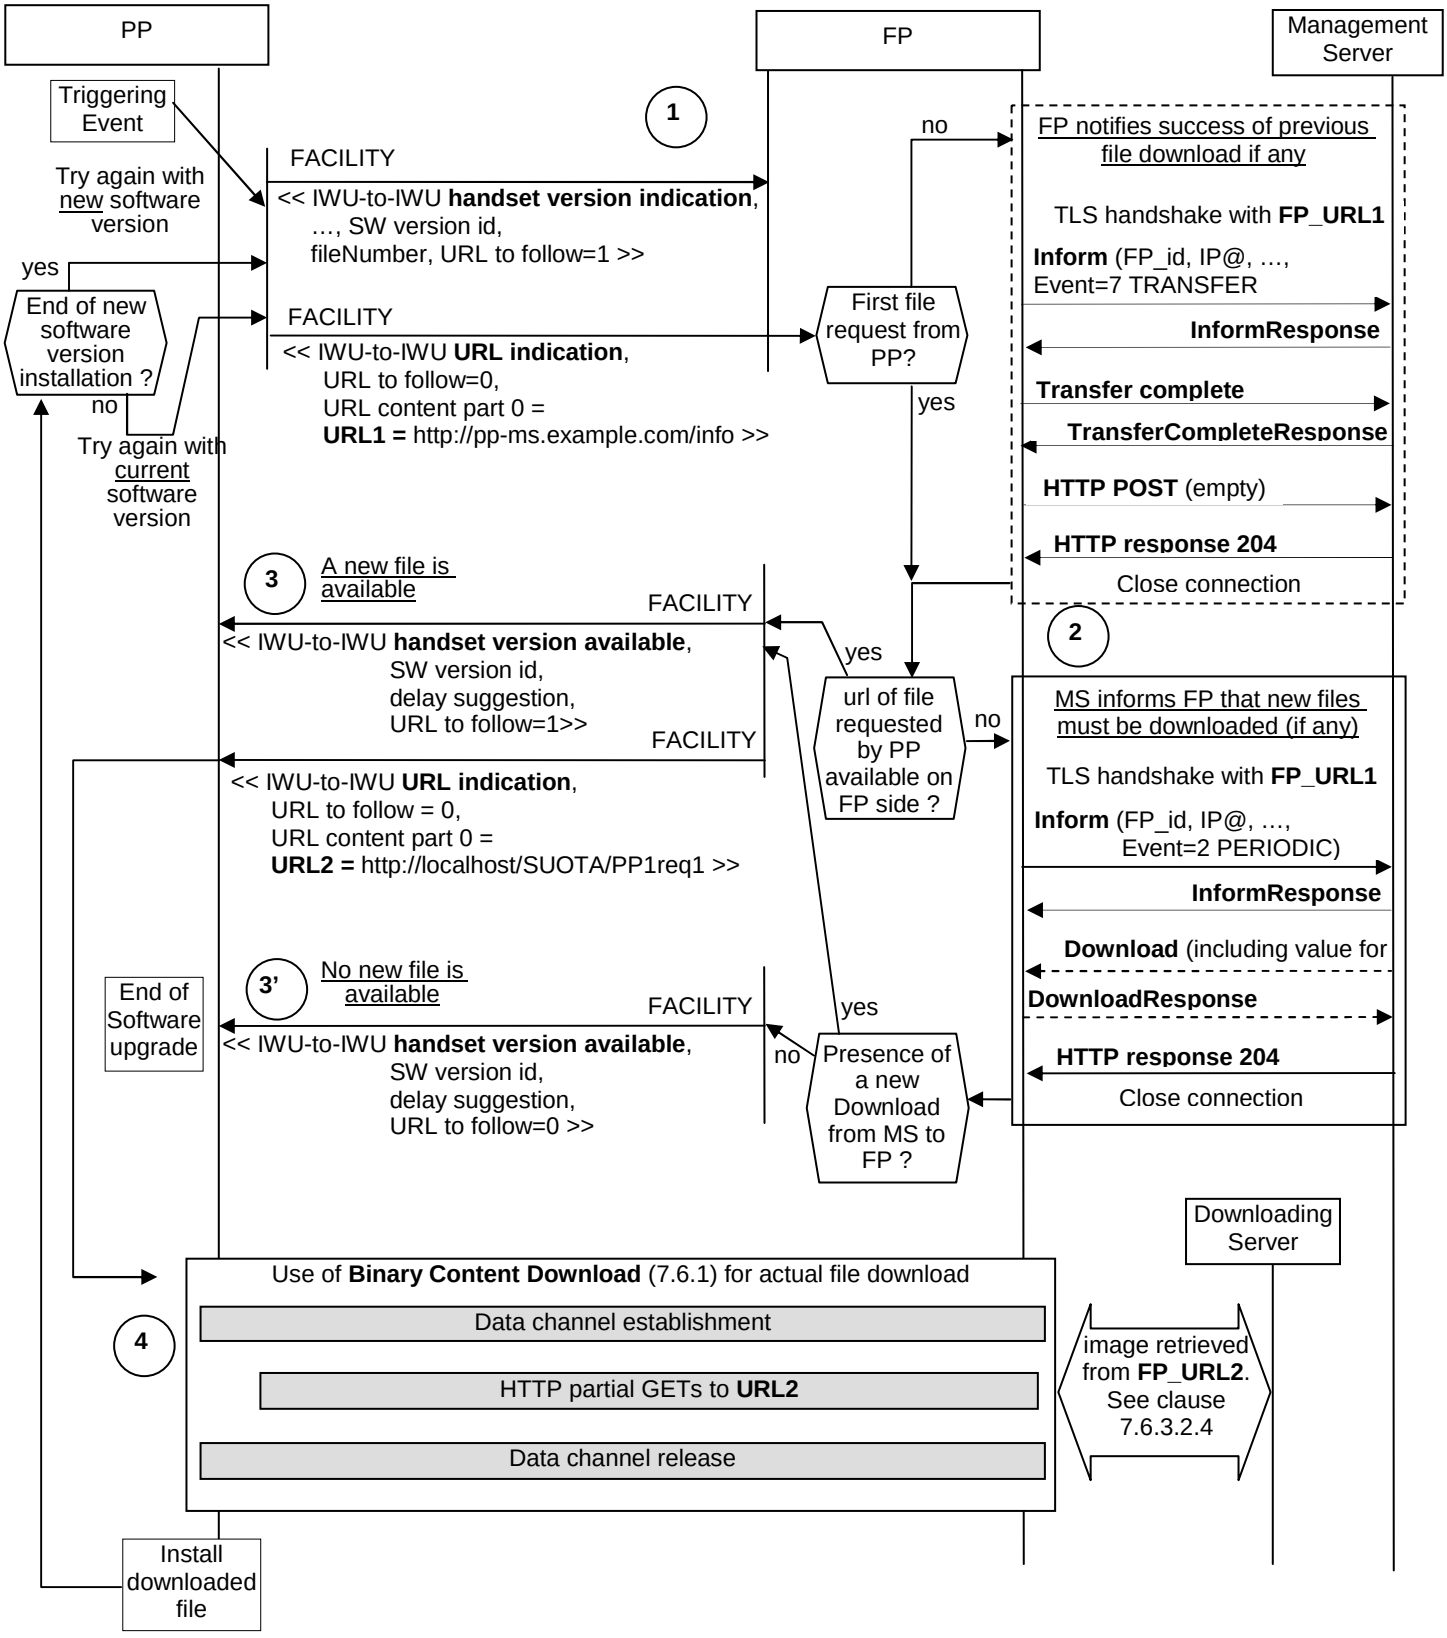

Figure C.4: Example of Enhanced SUOTA- FP as TR-069 client

C.4.2 Detailed messages

C.4.2.1 General message format

TR-069 uses a SOAP envelope encompassing each of the exchanged messages. The message itself is inserted as the soapenv:Body element content. For conciseness, the following envelope is not repeated in the message descriptions of the following clauses.

```
<soapenv:Envelope soapenv:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/"
                  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
                  xmlns:soap="http://schemas.xmlsoap.org/soap/encoding/"
                  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
                  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
                  xmlns="urn:dslforum-org:cwmp-1-0">

    <soapenv:Header>
       <ID soapenv:mustUnderstand="1"> <!-- Unique session ID defined by the session initiator--> </ID>
       <NoMoreRequests soapenv:mustUnderstand="0">1</NoMoreRequests>
    </soapenv:Header>

    <soapenv:Body>

       <!-Message content as described in the following clauses goes here-->

    </soapenv:Body>
</soapenv:Envelope>
```

The <ID> element content is a unique ID for the TR-069 session, chosen by the session initiator, and inserted by both sides (FP and management server) in every message pertaining to this session. Thanks to this ID the other side is able to uniquely identify the session to which a received message belongs.

C.4.2.2 Preliminary "Inform" exchange

C.4.2.2.1 Inform

Assumption is made here that the same session (hence the same "Inform" message) is used for both:

- the FP acknowledging a previous successful or failed "Download", using a "TransferComplete message. This accounts for the presence of an event of type "7 TRANSFER COMPLETE" in the Inform message <Event> element. The command key value for this event should be copied from the corresponding **Download** message.
- the MS requesting a download by the device (represented by the FP), using a "Download" message. This accounts for the presence of an event of type "2 PERIODIC" in the Inform message. The command key value for this event should remain empty.

```
<Inform>
   <DeviceId> <!--FP identification-->
      <Manufacturer>SUPPLIERXY</Manufacturer>
      <OUI>XXXXXX</OUI>   <!--Organizationally Unique Identifier-->
      <ProductClass>ProductZ</ProductClass>
      <SerialNumber>SN-XYZT</SerialNumber>
   </DeviceId>
   <Event soap:arrayType="cwmp:EventStruct[2]">
      <EventStruct>
         <EventCode>2 PERIODIC</EventCode>
         <CommandKey> <!-- Must remain empty --> </CommandKey>
      </EventStruct>
      <EventStruct>   <!-- This event indicates that the transferComplete method will be tried later in the session -->
         <EventCode>7 TRANSFER COMPLETE</EventCode>
         <CommandKey> <!-- command key copied from corresponding Download message --> </CommandKey>
      </EventStruct>
   </Event>
   <MaxEnvelopes>1</MaxEnvelopes>
   <CurrentTime>2008-09-15T15:40:00Z</CurrentTime>
   <RetryCount>0</RetryCount> <!-- starts at 0-->
   <ParameterList soap:arrayType="cwmp:ParameterValueStruct[6]">
      <ParameterValueStruct>
         <Name>Device.DeviceSummary</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
      <ParameterValueStruct>
         <Name>Device.DeviceInfo.HardwareVersion</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
      <ParameterValueStruct>
         <Name>Device.DeviceInfo.SoftwareVersion</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
      <ParameterValueStruct>
         <Name>Device.ManagementServer.ConnectionRequestURL</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
      <ParameterValueStruct>
         <Name>Device.ManagementServer.ParameterKey</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
      <ParameterValueStruct>
         <Name>Device.LAN.IPAddress</Name>
         <Value xsi:type="xsd:string"></Value>
      </ParameterValueStruct>
   </ParameterList>
</Inform>
```

NOTE: In this example, the value "2 PERIODIC" is used by the FP, indicating that the "**Inform**" request belongs to a set of periodically sent "Inform" messages. This is because the Inform message is supposed to be sent following a periodically sent "Handset Version Indication" command.

C.4.2.2.2 InformResponse

InformResponse from the management server acknowledges receipt of the Inform message.

```
<InformResponse>
   <MaxEnvelopes>1</MaxEnvelopes>
</InformResponse>
```

C.4.2.3 Download exchange

C.4.2.3.1 Download (from server to FP)

The **Download** message is the request from the management server that will cause the FP to download one file.

The time at which the download takes place is described in the message with a delay in seconds from the time when the message was received. In the corresponding "Handset version indication" command, the FP should therefore use a value of <DelayMinutes> = (DelaySeconds/60) minutes.

NOTE: The sequencing of actual file downloads with TR-069 is therefore time-based.

```
<Download>
   <CommandKey><!--server defined download instance ref.--></CommandKey>
   <FileType>1 Firmware Upgrade Image</Event>
   <URL> <!-- download target url = FP_URL2 --> </URL>
   <Username> <!-- if authentication needed --> </Username>
   <Password> <!-- if authentication needed --> </Password>
   <FileSize> <!-- file size in bytes --> </FileSize>
   <TargetFileName> <!-- in FP or PP file system --> </TargetFileName>
   <DelaySeconds> <!-- DelayMinutes = DelaySeconds/60 --> </DelaySeconds>
   <SuccessURL> <!-- optional, for browser --> </SuccessURL>
   <FailureURL> <!-- optional, for browser --> </FailureURL>
</Download>
```

C.4.2.3.2 DownloadResponse (from FP to server)

DownloadResponse is used in case of successful "**Download**" request. The FP should always set the status to "1", indicating that the download result will be notified in a subsequent TransferComplete message (i.e. the download will not take place immediately).

```
 <DownloadResponse>
   <Status> 1 </Status>
</DownloadResponse>
```

Error handling. In the following cases, the FP should answer the "Download" request with a fault message as defined in clause B.4.2.3:

- **9004 Resources exceeded:** if an attempt is made to queue an additional "Download" request when the FP's file transfer queue is already full.
- **9003 Invalid arguments:** should be used to reject the Download request if the FP detects the presence of the "userinfo" component in the file source URL.
- **9010 Download Failure:** if the FP rejects the Download request because the FileSize argument exceeds the available space on the device.
- **9012 File transfer server authentication failure** (associated with Upload, Download, TransferComplete or AutonomousTransferComplete methods).
- **9013 Unsupported protocol for file transfer** (associated with Upload and Download methods).

NOTE: The above list does not mention the all-purpose error codes described in clause B.4.2.3.

C.4.2.3.3 Preventing too many Download messages

The management server could attempt to send several "Download" requests in a row (i.e. not sending HTTP response 204 immediately). In case the FP wishes to handle a limited number of "Download" requests at a time, it may reply with a "9004 Resources exceeded" SOAP error message (see clause B.4.2.3).

NOTE 1: However, a FP using TR-069 should be able to queue at least three file transfers (download or upload).

NOTE 2: Whatever strategy is used on FP side, each file download will only start following a PP originating "Handset Version indication" message to the FP.

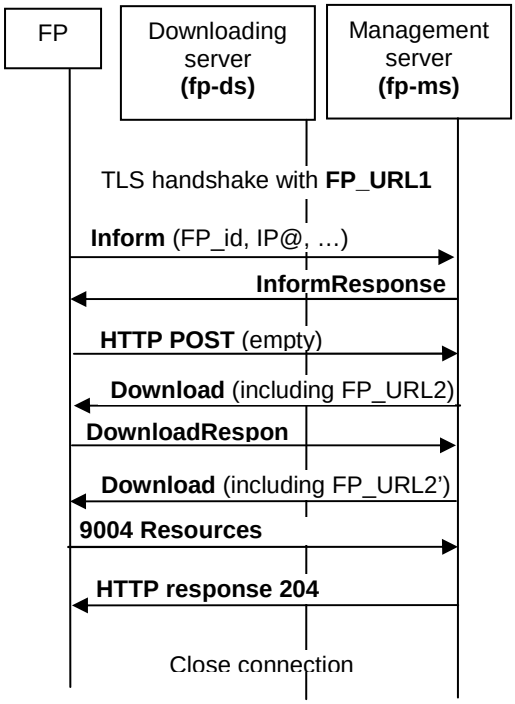

Figure C.5: Prevent multiple Download requests from the management server

C.4.2.4 Transfer complete exchange

For each download performed, the FP will send a distinct **TransferComplete** message to the management server. This message should only be sent upon successful download and use (e.g. installation, test) of the file. If the download and/or use of the file fails, the device should not retry the download but will use the **TransferComplete** message to report a failure to the management server.

C.4.2.4.1 TransferComplete (from FP to server)

The command key value should again be copied from the corresponding **Download** message (as for the Inform message).

```
<TransferComplete>
   <CommandKey> <!--server defined download instance ref.--> </CommandKey>
   <FaultStruct>
      <FaultCode></FaultCode>
      <FaultString></FaultString>
   </FaultStruct>
   <StartTime> </StartTime>
   <CompleteTime>  </CompleteTime>
</TransferComplete>
```

C.4.2.4.2 TransferCompleteResponse (from server to FP)

TransferCompleteResponse is an empty response message acknowledging receipt of the TransferComplete message.

```
<TransferCompleteResponse/>
```

C.4.2.5 Error handling-"Fault" message

In order to notify an error to the other party, the FP or management server should send a "Fault" message of the following form.

NOTE 1: A Fault message is sent on the SOAP layer.

```
<soap:Envelope
      xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
      xmlns:cwmp="urn:dslforum-org:cwmp-1-1">

   <soap:Header>
        <cwmp:ID soap:mustUnderstand="1">1234</cwmp:ID>
   </soap:Header>

   <soap:Body>
      <soap:Fault>
         <faultcode>Server</faultcode>
         <faultstring>CWMP fault</faultstring>
         <detail>
            <cwmp:Fault>
               <FaultCode>9000</FaultCode>
               <FaultString>Download method not supported</FaultString>
            </cwmp:Fault>
         </detail>
      </soap:Fault>
   </soap:Body>

</soap:Envelope>
```

NOTE 2: FP to management server error codes are of the form 9xxx. Management server to FP errors are of the form 8xxx.

All purpose error codes are defined in the following table:

Table C.1: Error codes

Management server to FP response (SOAP faultcode value = "Server")	FP to management server response (SOAP faultcode value = "Server")	Description
8000	9000	Method not supported
8001	9001	Request denied (no reason specified)
8002	9002	Internal error

C.4.2.6 Alternative exchanges

C.4.2.6.1 RequestDownload (from server to FP)

In some cases, the FP could use the RequestDownload message, in order to force a "Download".

NOTE 1: A management server could not implement this method.

NOTE 2: The FP cannot require a specific "Download" message instance.

```
<RequestDownload>
  <FileType>1 Firmware Upgrade Image</Event>
</RequestDownload>
```

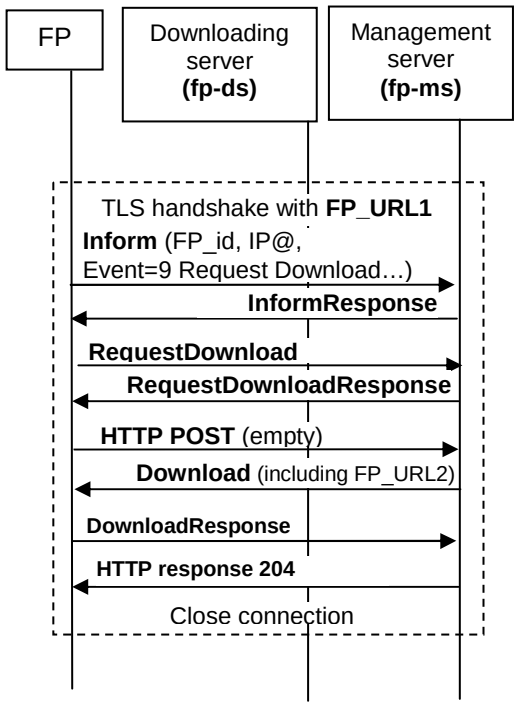

Figure C.6: Use of the RequestDownload method

C.4.2.6.2 RequestDownloadResponse (from server to FP)

RequestDownloadResponse is an empty response message acknowledging receipt of the RequestDownload message.

```
<RequestDownloadResponse/>
```

Error handling: In the following cases, the management server will answer the **RequestDownload** request with a fault message as defined in clause B.4.2.3, instead of a **RequestDownloadResponse** message. The applicable codes are the following:

	Error code	**Error string**	**SOAP faultcode**
-	8003	Invalid arguments	Client
-	8005	Retry request	Server

NOTE: The above list of applicable codes does not mention the all-purpose error codes described in clause B.4.2.3.
